X *      Cross Development System for Atari ST
X *     Copyright (c) 1988, Memorial University of Newfoundland
X *
X *   This routine uses the vertical blank interrupt queue to get it's timing
X * done.  This means that it probably depends on the resolution of the screen.
X *   If there is no room in the vbl queue then -1 is returned.  Note that
X * before the program terminates, this routine must be taken out of the
X * queue - to do this, _unalarm() is called from exit().  If alarm() is
X * not used in the program, the _unalarm() routine is a null one.
X *   This routine works by messing with the return pc (and sr) on the stack
X * when it gets called from the vbl interupt routine.  Also, the routine
X * checks to make sure a trap is not in progress by checking the __in_trap
X * variable (which *must* be set to one before a trap is done, and cleared
X * afer by the programmer - this is normally handled by the __*bios routines).
X * All this weirdness is done to ensure that the os is not disturbed while
X * it is doing stuff - therefor it is safe to do a longjmp() inside a signal
X * handling routine.
X *
X * $Header: alarm.c,v 1.1 88/02/03 22:37:51 m68k Exp $

X|
X|       Cross Development System for Atari ST
X|      Copyright (c) 1988, Memorial University of Newfoundland
X|
X|  C start-up routine.  Has several tasks to do:
X|   release unneeded memory to the system
X|   set up stack
X|   set up argc, argv, and envp
X|   set up an address trap handler for bsr.l instructions
X|  Also defines _exit() so the address error handler can be restored
X|
X| $Header: /chandra/Gnu/atari/cross-lib/RCS/crt0.s,v 1.3 89/03/10 20:49:42 bammi
Exp $
X| $Header: crt0.s,v 1.3 88/02/03 20:23:26 m68k Exp $
X|
X| Revision 1.9  89/08/15  er
X| Merged local version and version from terminator together
X| completely removed __in_trap flag (it's no longer needed - cf. signal.c)
X|
X| FIXME: all this revision number confusion should be cleaned up
X|
X| Revision 1.8  89/08/07  er
X| Added _init_timer and _exit_timer to do signal processing for SIGALRM/SIGHUP
X| Added argc/argv for accessories (just dummies)
X|
X| $Log: crt0.s,v $
X| Revision 1.3  89/03/10  20:49:42  bammi
```

```
X| backed out Fforce(2,Fdup(1)) due to problems with redirections.
X| Revision 1.7  89/08/01  sb
X|     New argc/argv parsing for the commandline. Old code didn't recognize
X| multiple blanks between arguments and supplied each blank as "" argument.
X|     Accessories need their own stack.
X| Sample code in the main-module:
X|   #define STACKSIZE 8000L
X|   char my_private_acc_stack[STACKSIZE];
X|   extern long _heapbase = (long) my_private_acc_stack;
X|   extern long _stksize  = STACKSIZE;
X|
X| Revision 1.2  89/03/08  22:20:51  bammi
X| Many hacks etc. Version as distributed with Gcc V1.34
X|
X| Revision 1.1  89/03/08  21:57:52  bammi
X| Initial revision
X|
X| Revision 1.6  89/07/19  er/sb/AD
X| __in_trap flags removed from early trap calls since alarm can't yet be there
X| added stuff from sb (__app and accessory support) and AD (malloc changes)
X|  Revision 1.2.1  89/02/06  AD (Atze Dijkstra)
X|  Changed malloc/stack mgt so stack is on top of heap
X|  and they will grow to each other.
X|  These will only be if __stksize == -1L
X|  See also memory.c
X|
X| Revision 1.5  89/07/06  er
X| changed to xArg parameter passing
X|
X| Revision 1.4  89/06/02  er
X| Added support for extended argument passing via PBP/ARGV
X| Installs trap handler for etv_term to restore alarm-routine and address-
X| error-handler. This handler catches also ^C pressed during TOS-i/o.
X| Added data_start and _base
X| TODO: _exit could be removed now from this code so the user can redefine it
X|
X| $Log: crt0.s,v $
X| Revision 1.3  88/02/03  20:23:26  m68k
X| Added __in_trap flag - see atari/alarm()
X|
X| Revision 1.2  88/01/29  17:24:37  m68k
X| Re-wrote the argument parsing stuff
X| Calls exit() instead of _exit()
X| uses Setvec() trap instead of Super()/mov/Super() to change the ae trap
X| stack now has initial size of 8k (up from 2)
X|
X|

X    addql    #4, sp
X    moveml   sp@+, a0-a5/d1-d7
X|
X| ignore ^C now
X| this trick depends on the following facts:
X| 1. the TOS-i/o routine calls Pterm(-32) directly as a function and removes
X|    the parameter (-32) if this routine eventually comes back
X| 2. Pterm itself calls the logical vector 0x102 (etv_term) via assembler
X|    and so the register a6 points to the params of Pterm
X| 3. after the 'unlk a6', we can return to the caller of Pterm just with 'rts'
X|
X    unlk a6
```

```

X    | The End.
X
X|  This is a trap handler for address errors.  It is used in doing long
X| branches and long bsrs.  It looks to see if a long branch (0x6?ff) caused
X| the trap and if the destination is valid (not an odd address).  If so
X| the branch is taken and we return, otherwise, we call the old address
X| trapper.

X *
X * $Log: read.c,v $
X *
X * 1.5       er
X *
X * Added /dev/null dummy handle.
X * Fix it : When adding 'continue' after raise(SIGINT) and raise(SIGQUIT), get
X *      unexpected results in Emacs (perhaps problems with EOF in fgetc()).
X * Moved __col_pos to write.c (it's always included because of fflush in exit)
X *
X * 1.4       er
X *
X * Revision 1.4    89/01/15
X * Added support for function keys (they give an Esc-sequence with the
X * scan-code as parameter), META-key (Alternate sets the highest bit) and
X * O_NDELAY mode (no waiting if there is no available input). META-translation
X * is controled via the META-bit in __ttymode (set by ioctl()).
X *
X * 1.3       jrd
X *
X * Revision 1.2  88/02/03  22:56:30  m68k
X * Added unix like tty driver stuff
X *
X * Revision 1.1  88/01/29  17:31:39  m68k

X/* Dynamic memory allocation for GNU.
X   Copyright (C) 1985 Richard M. Stallman,
X    based mostly on the public domain work of others.
X
XThis program is distributed in the hope that it will be useful,
Xbut without any warranty.  No author or distributor
Xaccepts responsibility to anyone for the consequences of using it
Xor for whether it serves any particular purpose or works at all,
Xunless he says so in writing.
X
X   Permission is granted to anyone to distribute verbatim copies
X   of this program's source code as received, in any medium, provided that
X   the copyright notice, the nonwarraty notice above
X   and this permission notice are preserved,
X   and that the distributor grants the recipient all rights
X   for further redistribution as permitted by this notice,
X   and informs him of these rights.
X
X   Permission is granted to distribute modified versions of this
X   program's source code, or of portions of it, under the above
X   conditions, plus the conditions that all changed files carry
X   prominent notices stating who last changed them and that the
X   derived material, including anything packaged together with it and
X   conceptually functioning as a modification of it rather than an
X   application of it, is in its entirety subject to a permission
X   notice identical to this one.
X
X   Permission is granted to distribute this program (verbatim or
X   as modified) in compiled or executable form, provided verbatim
X   redistribution is permitted as stated above for source code, and
X    A.  it is accompanied by the corresponding machine-readable
X      source code, under the above conditions, or
X    B.  it is accompanied by a written offer, with no time limit,
X      to distribute the corresponding machine-readable source code,
X      under the above conditions, to any one, in return for reimbursement
X      of the cost of distribution.   Verbatim redistribution of the
```

```
X      written offer must be permitted.  Or,
X    C.  it is distributed by someone who received only the
X      compiled or executable form, and is accompanied by a copy of the
X      written offer of source code which he received along with it.
X
X   Permission is granted to distribute this program (verbatim or as modified)
X   in executable form as part of a larger system provided that the source
X   code for this program, including any modifications used,
X   is also distributed or offered as stated in the preceding paragraph.
X
XIn other words, you are welcome to use, share and improve this program.
XYou are forbidden to forbid anyone else to use, share and improve
Xwhat you give them.   Help stamp out software-hoarding!  */

X/*
X * @(#)nmalloc.c 1 (Caltech) 2/21/82
X *
X *  U of M Modified: 20 Jun 1983 ACT: strange hacks for Emacs
X *
X *  Nov 1983, Mike@BRL, Added support for 4.1C/4.2 BSD.
X *
X * This is a very fast storage allocator.  It allocates blocks of a small
X * number of different sizes, and keeps free lists of each size.  Blocks
X * that don't exactly fit are passed up to the next larger size.  In this
X * implementation, the available sizes are (2^n)-4 (or -16) bytes long.
X * This is designed for use in a program that uses vast quantities of
X * memory, but bombs when it runs out.  To make it a little better, it
X * warns the user when he starts to get near the end.
X *
X * June 84, ACT: modified rcheck code to check the range given to malloc,
X * rather than the range determined by the 2-power used.
X *
X * Jan 85, RMS: calls malloc_warning to issue warning on nearly full.
X * No longer Emacs-specific; can serve as all-purpose malloc for GNU.
X * You should call malloc_init to reinitialize after loading dumped Emacs.
X * Call malloc_stats to get info on memory stats if MSTATS turned on.
X * realloc knows how to return same block given, just changing its size,
X * if the power of 2 is correct.
X */
X
X/*
X * nextf[i] is the pointer to the next free block of size 2^(i+3).  The
X * smallest allocatable block is 8 bytes.  The overhead information will
X * go in the first long of the block, and the returned pointer will point
X * to the second.
X *
X#ifdef MSTATS
X * nmalloc[i] is the difference between the number of mallocs and frees
X * for a given block size.
X#endif /* MSTATS */

Submitted-by: uunet.UU.NET!unido!sbsvax!roeder (Edgar Roeder)
Posting-number: Volume 2, Issue 79
Archive-name: gcclib2-patch1

Once again Murphy has caught me. In the GCC library posted was a little bug.
When seeking on an output file (like stdout) the old code tried to read in a
new buffer from that 'file'. On stdout this means that on every fflush-call
the program reads one line of text. There was also a typo in the CR/LF
conversion of fgetc.
```

The files in the appended shar archive should replace the corresponding files
of the library.

     - Edgar

```
------------------------------------------------------------------------------
#!/bin/sh
# shar:  Shell Archiver  (v1.22)
#
#    Run the following text with /bin/sh to create:
#      console.c
#      fgetc.c
#      fseek.c
#      read.c
#      include/osbind.h
#
sed 's/^X//' << 'SHAR_EOF' > console.c &&
X/* console IO stuff.  Abstracted out here cause I'm having so much trouble
X   getting Bconout and Cconout to work.
X
X   Well, after a lot of fooling around, it looks like I can almost get the
X   effect I want (single byte read with no echo) by doing Freads with
X   length 1.  That does everything right except that it echos printable
X   ascii chars; ie anything #x20 .. #x7F.  We kludge around that by
X   arranging for the caller (read) to know which chars have been echoed.
X   Sigh.
X
X   There seem to be some people in the atari st community who have never
X   heard about the st's character set. There are some chars > 0x7F which
X   can be printed. And they will be printed.
X   This code assumes that nowbody tries to read from stderr if stdin is
X   redirected to AUX:. (er)
X   If we use Crawcin()/Cconis() we avoid problems with typeahead.

X *
X * $Log: read.c,v $
X *
X * 1.5       er
X *
X * Added /dev/null dummy handle.
X * Fix it : When adding 'continue' after raise(SIGINT) and raise(SIGQUIT), get
X *      unexpected results in Emacs (perhaps problems with EOF in fgetc()).
X * Moved __col_pos to write.c (it's always included because of fflush in exit)
X *
X * 1.4       er
X *
X * Revision 1.4    89/01/15
X * Added support for function keys (they give an Esc-sequence with the
X * scan-code as parameter), META-key (Alternate sets the highest bit) and
X * O_NDELAY mode (no waiting if there is no available input). META-translation
X * is controled via the META-bit in __ttymode (set by ioctl()).
```

```
X *
X * 1.3       jrd
X *
X * Revision 1.2  88/02/03  22:56:30  m68k
X * Added unix like tty driver stuff
X *
X * Revision 1.1  88/01/29  17:31:39  m68k
X * Initial revision
X *

Submitted-by: SQ79%liverpool.ac.uk@NSFnet-Relay.AC.UK (Mark Powell)
Posting-number: Volume 2, Issue 80
Archive-name: mandel

Here is the source to the Mandelbrot generator that has just been posted
to the binaries newsgroup. Sorry about the lack of comments, but thats
just the sloppy way I program.

Mark Powell

```
#! /bin/sh
# This is a shell archive.  Remove anything before this line, then unpack
# it by saving it into a file and typing "sh file".  To overwrite existing
# files, type "sh file -c".  You can also feed this as standard input via
# unshar, or by typing "sh <file", e.g..  If this archive is complete, you
# will see the following message at the end:
#        "End of shell archive."

```
OK, i've seen some Diff programs posted here. Here is another.
This is the comparision program i made up to help me debug. All i ask
is that if changes are made, that the new code be uploaded to the
nearest BBS and that this code not be uploaded to the compu-serve
network. (Had a tiff with them 7 years ago, long story...)
Have fun with it....

Stuart

PS: One modification i ment to do but never did, the adress that the
    files Bload into should be even. It will speed up the process by
    50% load time.

X'
X'    File Comparision Program by Stuart Carter  Version 3.15       c1988
X'
X'  I Have made this program avalible to the the public with the following
X'  rules:
```

```
X'
X'  1) Neither this work or any derivative of it will be sold for profit.
X'  2) This program may not be distibuted by or thru the Compu-Serve network.
X'  3) Any person Altering and uploading this code MUST:
X'       a)Add name and date to 'Modifying' author's list and
X'       b)Increment Version counter and
X'       c)Upload new modifed source code.
X'
X' Thats all...
X' Stuart Carter        (502)/491-0126       Bitnet: WSCART01@ULKYVX
X' Add Modifying authors names here...

These are the source files of builds 0.9, a program which creates
Motorola S-records from Atari ST binary (.ttp) files.

X
X        builds version 0.9  17-Sep-89
X        ----------------------------
X
XThis program was developed to allow downloading code/data to a target
X68000 system via the serial port using the Motorola S-record format.
X
XBuilds produces S2-record files from ST .ttp executables. (There are
Xthree different S-record formats; S1, S2 and S3, for 16-, 24- and 32-bit
Xaddresses, respectively.)
X
XUsage:  builds [-address] [-v] file
X
X    "address" is the (24-bit) load- and execution address, and
X    should be entered in hex format WITHOUT a leading "0x". The
X    code is  relocated in the same way as the ST does when loading
X    a program. "address" defaults to zero.
X
X    "v" displays the program version.
X
XThe S-record file is written to stdout to allow redirection to a file
Xor the serial port using your favourite shell.
X
XCompiled with Sozobon C.

Submitted-by: clong@topaz.rutgers.edu (Chris Long)
Posting-number: Volume 2, Issue 84
Archive-name: colorca

Here's a little CA (cellular automaton) program written by me and
a friend many moons ago.  I've included one version for color low-res,
and another for color high-res (better known as low- and med-res,
respectively).  I've also included my desktop.inf, which seems to set
the colors rather nicely for the med-res version.  Have fun!  If you
liked this program, let me know.

BTW, let it run.  Just when you think it's reached a steady-state,
it'll do something completely unexpected.

Submitted-by: ntomczak@ualtavm.bitnet (Michal Jaegermann)
Posting-number: Volume 2, Issue 85
Archive-name: eternal3

   Recently Volker A. Brandt (VBRANDT@DBNUAMA1.BITNET) posted in
comp.sys.atari.st binaries for a nice, small, sweet and fast reset proof
ram-drive which works also on Mega 4. But these were only binaries.
For all of you who would like to 'roll your own' here is a source
of similar ram-drive which I am using, with a great success, for quite
a while. Please check details of operation in a header comment.

   This code works also with Rainbow TOS without any problems.

   If you are going to enter 'ram-drives demolition derby' then you
may want to recode a read-write loop rw_l1 using 'moveml.' trick. You
will be probably able to measure a difference, though I do not know
if you will notice it. Happy hacking...

```
;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;here I come;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;;
********
*
*   etrnl3/4.s - a version of resizable reset-proff ram-drive
*                modified to work also on Mega4
*
*   An original of code eternal by John Franco.
*   This code modifies and fixes some bugs of eternal2.
*
*   A 'fractional' name of this program - eternal 3 for Mega 4 -
*   follows a fine tradition originated by one operating system.
*
*   Changes to work on Mega4 - by Michal Jaegermann, 23 May 1988
*    this code also somehow modified in other places
*
*   Assemble this source with as68.
*
*   An unmodified source will produce a ram-drive which will be
*   installed as a drive m: with size of 300k, unless you have
*   Mega 4, in which case a default size will be 1M.
*
*   This program, when executed first time, will set a number of pointers
*   and it will reset your computer.  Execute the second time in order
*   to install ram-drive.  To automate that process, put, as the
*   FIRST program in AUTO folder.  If, on a reset,  an old ram-drive is found,
*   and no keys will intervene, then its contents will be, hopefully,
*   restored.
*
*   If some other program plays the same games with phystop pointer
*   as this program, then etrnl3/4 will be not installed, unless you
```

```
*   will force it by pressing an 'Alternate' key.  In that case, too bad
*   for the other program.
*
*   If a 'Control' key is held down, then ram-drive will be not installed.
*   If a ram drive was installed - it will be unmounted and a computer will
*   reset.  A message wil appear and it will stay until you hit a
*   'Return' key. If this program is in AUTO folder, hit 'Control' once
*   again, in order to prevent an installation of default ram-drive
*   during boot-up sequence.
*
*   'Alternate' key will let you specify drive letter and size of a ram
*   drive to install.  Already installed ram-drive will be replaced
*   with a new one.  During this process an old contents of the ram-drive
*   is wiped out.  Even if a drive letter and size remain unchanged!
*   An example of a ram drive specification - 'p200'.  Your input
*   is not checked, so be careful. Do not use drive letters already taken,
*   unless resizing ram-drive previously mounted by etrnl3/4.prg
*
*   NOTE:  For ram-drives installed with sizes around 2 MBytes and over
*   some version of TOS will come out with a wrong size information when
*   inquired from Desktop.  'df' function in gulaam fares much better.
*   If somebody has an explanation for this behaviour I am all ears.
*   It is really not very well tested when amounts of memory allocated
*   to ram-drive are in eccess of 3 MBytes.
*

Here is yet another version of an Atari ST file finder. This one is
a no-frills version meant to be used from a shell (gulam, msh etc.);
it will run from the desktop though. As the basic machinery was
there, I went a little option-crazy and included stuff like filesize
counting etc.

```
#!/bin/sh
# shar:  Shell Archiver  (v1.22)
#
#    Run the following text with /bin/sh to create:
#      FF.C
#      FF.MAN
#      MAKEFILE
#
sed 's/^X//' << 'SHAR_EOF' > FF.C &&
X
X
X/*
X * Searches recursively for all directory entries matching a given
X * specification beginning at the directory specified.
X * See ff.man for details.
X *
X * For ST-TOS, MWC 3.05.
X * History: 17-SEP-87
X *          06-JUL-89 regexp as filespec; -x option
X *          24-JUL-89 file sizes
X */

X
XNAME
X    ff  -  _f_i_l_e_f_i_n_d: recursive search for files
X
XSYNOPSIS
X
X    ff [-cqvsktd] [-aatts] [-iatts] [-x command] 'filespec'
X
XDESCRIPTION
X
X    ff takes everything up to the last backslash as the directory to
X    start searching (default is the current directory).  The rest of
X    filespec is the pattern.  ff will list all files (with their complete
X    paths) whose last names match this pattern, recursively scanning all
X    subdirectories.  filespec may begin with a drive specification
X    (ending with a colon; a backslash should follow), which is matched
X    against all drives present.
X
X    ff uses the MWC routine pnmatch() for the pattern match;  thus,
X    permissible wildcards are * (matches any sequence of characters),
X    ? (matches any one character), and character lists enclosed in
X    brackets ([]).
X
X    Flags:
X         -c   _C_o_u_n_t: print number of files found.
X         -q   _Q_u_i_e_t: print no filenames or extra messages.
X         -v   _V_e_r_b_o_s_e: list directories searched.
X         -aatts   Include only files with these _a_t_t_r_i_b_u_t_e_s
X              (r,h,s,d,m for readonly, hidden, system, subdir,
X              modified flag, respectively).
X         -iatts   _I_g_n_o_r_e files with these attributes (default: d).
X         -s   _S_i_z_e: list file sizes and total.
X         -t   Suppress _t_o_t_a_l.
X         -k   _k_B_y_t_e: round sizes to multiples of 1024 (implies -s).
X              On systems with a cluster size of 1 kByte, this should
X              report the space actually used by the files.
X         -d   List subtotal for each _s_u_b_d_i_r_e_c_t_o_r_y (implies -s).
X         -x cmd   For each match, _e_x_e_c_u_t_e command cmd
X              using msh, where %% is replaced with the filename.
X
X    Exit status:  The number of matching filenames found, or a negative
X              error number.
X
XEXAMPLES
X
```

```
X    ff 'hugo' find files named hugo, beginning at the current
X              directory.
X    ff -c '*' find all files, beginning at the current directory,
X              reporting the number of files found.
X    ff '?:\*.c'   find all C source files on all existing drives.
X    ff -am '[cd]:\hugo\*'  find all files, beginning at the
X              subdirectories "c:\hugo" and "d:\hugo", which have
X              the "modified" attribute set.
X
XRESTRICTIONS
X
X    - For the -x option, msh.prg must be in the search path.
X    - The files are listed in the order in which they appear in the
X      directory (i.e., not sorted in any way).
X    - As the backslash is the directory seperator, there is no escape
X      character available for the wildcard characters.
X
XNOTES
X
X    - The filespec must be enclosed in quotes if the shell used
X      would otherwise expand the wildcards.  Contemplate the
X      difference between "ff *.c" and "ff '*.c'" under gulam (or msh).
X    - Arguments are forced to lower case (for use from the desktop under
X      old TOS versions).
X    - "ff -qkd 'dir\*'" is roughly equivalent to "du dir".
X    - Very convenient under msh using backquotes:
X      rm `ff '*'`  is equivalent to UNIX rm -r, with the
X      exception that subdirectories are not deleted, and that the msh
X      cannot process an unlimited number of arguments that way.
X
XWARNINGS
X
X    As ff may traverse quite a few directories, you might run into
X    the _4_0_-_f_o_l_d_e_r_-_b_u_g (discussed at length elsewhere).
X
XTODO
X    - There should be support for matching against the file timestamps.
X    - ff should, instead of just calling system(), use the gulam shell
X      interface if present.
X    - There should be a replacement for the pnmatch() escape character.
X
XFILES
X    ff.ttp

SHAR_EOF
chmod 0600 STRINGS.C || echo "restore of STRINGS.C fails"
sed 's/^X//' << 'SHAR_EOF' > STRINGS.MAN &&
XSTRINGS(1)            USER COMMANDS
X
```

```
X
XNAME
X    strings  -  extract strings from binary file
X
XSYNOPSIS
X    strings [-adoxnv] [-m <number>] [-c chars] filename
X
XDESCRIPTION
X    Extracts and prints sequences of printable characters, terminated by
X    a _z_e_r_o _b_y_t_e, from the _d_a_t_a segment of the specified file, which
is
X    assumed to be a GEMDOS executable.
X    Strings are listed in C-format, i.e. as they would be accepted
X    as string constants in C.  Strings shorter than 4 characters are
X    ignored.  Printable characters are '\t', '\n', and ASCII 32 to 126.
X
X    Options:
X
X    -a   All:  Search the _c_o_m_p_l_e_t_e file (regardless of its format).
X    -d   _D_e_c_i_m_a_l: Precede each string with its _p_o_s_i_t_i_o_n in the
file.
X    -o   _O_c_t_a_l: Same as -d, only in octal.
X    -x   _H_e_x_a_d_e_c_i_m_a_l: Same as -d, only in hex.
X    -l   Literal: Print strings _l_i_t_e_r_a_l_l_y (i.e., not in C-format).
X    -n   Newline: Accept '\n' and '\r' as string _t_e_r_m_i_n_a_t_o_r_s.
X    -m <no>  _M_i_n_i_m_u_m length:  Ignore strings shorter than <no> characters.
X    -c <ch>  _C_h_a_r_a_c_t_e_r_s: Regard the specified chars as
_p_r_i_n_t_a_b_l_e.
X    -u   _U_m_l_a_u_t_s: Regard "umlaut" characters as printable ("").
X    -v   _V_e_r_b_o_s_e:  List the segment sizes.
X
XRESTRICTIONS
X    Printing of strings is limited to the internal buffer size of 1024
X    characters.
X
XBUGS
X    When printing in C-format, characters greater than 126 are not
X    escaped by '\\ddd' (only with -c or -u options).

Posting-number: Volume 2, Issue 90
Archive-name: curses/part01

Following a request on comp.sys.atari.st, here's the source to
curses. Apologies to the original author, TWINKLE.TOS didn't
appear in the posting where I obtained this, the poster wanted to
post plain text - understandable. [Since that's the way I want
sources submitted, VERY understandable. :) -sg]

Cheers,

Graham

X
X
X
X
X    This document describes a set of C-functions which allow the user
Xeasier design of full-screen applications. This package is intended for
```

Xprograms that perform graphics-like operations on terminal screens.
XIt is largely compatible with the UN*X curses(3x) package. This document
Xprovides pointers to its use, a little detail about its inner workings and it
Xstresses differences between the UN*X-implementation and the Atari-ST series
Ximplementation.
X
X
X
X
X
X
X   Introduction.
X
X   This package was born out of my desire to make more programs available for
XUN*X also available on my Atari. A side-effect of this is that it provides
Xeasier screen updating than by means of sending escape codes. The package is
Xalso quite fast, timing of a sample application yielded a rate of about
X90 kilobaud per second.
X
X   Terminology.
X
X   Throughout this document the following words will be used frequently :
X
XWINDOW   An internal representation of what a section of the terminal
X   screen may eventually look like. A window is a rectangular
X   array, which may be as big as the terminal screen or even as
X   small as a single character.
X
XTERMINAL   Or terminal screen, the packages idea of what the Atari's VT52
X   emulation looks like. If everything is allright this is what you
X   see. The terminal screen is a special screen.
X
XSCREEN   A screen is an element of the set of windows that are as large as
X   the terminal screen. One screen, called stdscr, is already
X   provided for.
X
X   Using the package.
X
X   To use the package, include the file "curses.h" in your source. This gives
Xyou the types and definitions necessary to be able to use it. After compilation
Xone should link with the file containing the compiled curses-source, as well as
Xwith the object-file or library giving you access to the system calls,
Xgemdos, bios and xbios. You also should link in a file giving you access
Xto the malloc() and free() calls. (Note : this is not the GEMDOS Malloc/Mfree
Xpair, but a malloc() and free(), which should be contained in any decent
Xstandard C-function library. GEMDOS Malloc/Mfree are very buggy indeed.)
XThere is a difference with UN*X here : the UN*X-curses includes stdio.h
Xand sgtty.h, whereas Atari-curses includes portab.h and stdio.h. This should
Xgive you the definitions for BYTE, WORD and LONG.
X Some compilers supply default startup files that don't supply enough heap space
Xto run curses in, you should adapt these startup files to your liking.
X
X   Installing the package.

X
X   Compile the file "curses.c" with your favorite C-compiler, to create an
Xobject-file or library, whatever you prefer. Curses.c includes "portab.h"
Xfor BYTE, WORD, LONG, and NULL definitions, osbind.h for system-call macros
Xand curses.h for its own definitions. Remember curses.h also includes stdio.h.
XThe code should be portable between various brands of compilers. Forget about
Xwarnings like : warning : pointer substraction yields a long result.
XNot all compilers adhere to Kernighan and Ritchie standards in this respect.
XThe meaning of each of the constants is given in the table below. In another
Xtable the used system call macro's are given.
X
X+---------------+---+
X| constant name | meaning |
X+===============+===+
X| BYTE | a type with at least 8 bits in it, usually a char |
X| WORD | a type with at least 16 bits in it |
X| LONG | a type with at least 32 bits, used for pointers |
X| NULL | a value assigned to pointers pointing nowhere |
X+---------------+---+
X
X+---------------+---+
X| macro name | meaning |
X+===============+===+
X| Pterm | gemdos $4c, terminate process and return to caller |
X| Cconis | gemdos $0b, console character available ? |
X| Crawcin | gemdos $07, get a raw character from console |
X| Cnecin | gemdos $08, get a not-so raw character from console |
X| Bconout | bios $03, output a character to a device |
X| Bconstat | bios $01, get input device status |
X| Bconin | bios $02, input a character from a device |
X| Supexec | xbios $26, execute function in supervisor mode |
X+---------------+---+
X
X   Screen updating.
X
X   The package defines a data type called WINDOW, which represents what a
Xsection of the terminal may eventually look like. It can be used as a
Xscratch-pad onto which you can make changes. Only after calling
Xthe function refresh() or wrefresh() an attempt will be made by the package
Xto make things on the screen look like the things you specified in the
Xwindow. Information contained in the window include not only its contents,
Xbut also its size, its starting point and various other information. Two
Xstandard window are defined after initialization of the package, namely
Xcurscr, which constitutes the package's idea of what the screen looks like,
Xand stdscr, which is a default window to make changes on. It is advised not
Xto address curscr directly, but first to make changes on another window and
Xthen to call refresh() or wrefresh() to make curscr look like the other
Xwindow. Making a change on curscr results in immediate execution of the
Xchange, this greatly reduces any chances of optimization and therefore results
Xin a sizeable loss of speed (unless you know what you're doing, of course).
X
X   Naming conventions.
X

X   All output and input functions can be used with any window. These functions
Xhave two variants, one to act on the default screen stdscr, and another to
Xact on any window. An example is the function addch(), which adds a character
Xto stdscr. The variant, which adds a character to a window w is called
Xwaddch() and takes w as an argument. This convention is used throughout the
Xpackage. The routines which do not adhere to this convention always take a
Xwindow as an argument.
X   Apart from the w-convention some functions also take a mv- prefix.
XOrdinarily one moves the current coordinates of a window by calling
Xthe move or wmove function. Preceding an I/O function by mv first moves
Xthe current coordinates and then performs the I/O function. In this way
Xone can write the sequence :
X
Xmove(y,x) ;
Xaddch('Q') ;
X
Xas :
X
Xmvaddch(y,x,'Q') ;
X
Xand the sequence :
X
Xwmove(win,y,x) ;
Xwaddch(win,'W') ;
X
Xmay be replaced by :
X
Xmvwaddch(win,y,x,'W') ;
X
XYou may have noticed the following other conventions :
X1. If a window must be specified as a parameter, it is always the first
X   parameter.
X2. Coordinates are specified as (y,x) pairs, where y is in the up/down
X   direction, and x in the letf/right direction, the coordinate (0,0) is
X   in the upper-left corner of the window.
X
X
X   Programming with curses.
X
X   The following sections deal with programming with the library.
XFirst of all curses should be initialized first. This is done by a call to
Xinitscr(). On return curses will have initialized the screen to a state known
Xby curses, and have initialized curscr and stdscr, whereas prior to the
Xinitscr() call, any reference to curscr or stdscr will result in bombs.
XAfter calling initscr() you should perform any terminal status changing
Xroutines like crmode() or nonl(), although these may be performed anytime
Xwhen curses is active. After that you can set up the screen status using
Xfunctions like leaveok() and scrollok() or allocate new windows with newwin()
Xor subwin(), delete them with delwin().
X   Calling initscr() again will either result in a redraw of the screen or
Xanother initialization step when the variables LINES or COLS have changed.
XThis enables you to set the screen size by hand, because normally
Xthe variables LINES and COLS contain the true size of the terminal. Calling

```
Xinitscr ni such a way again, results in the deletion and regeneration of
Xcurscr and stdscr.
X   The basic functions that allow you to change the contents of a window
Xare addch() and move(). Addch() adds a character to a window and move() moves
Xthe current coordinates. Other output functions exist to let you do some
Xmore elaborate things, like addstr() to add an entire string, insertln() to
Xinsert a line etc.. When you have composed the contents of the window to your
Xliking you can call refresh() to make the portion of the terminal screen
Xoverlapped by the window look like the window. When updating one must keep
Xin mind that refresh assumes that parts of the window not changed since the
Xlast update of the window are also not changed on the terminal. Use the
Xtouchwin() function to let curses think the entire window has changed when
Xusing overlapping windows.
X   Calling wrefresh() with curscr as an argument results in a complete redraw
Xof the terminal screen. Because curses has to know what the contents of the
Xphysical screen is at all times, you should not do any other screen output,
Xthan by curses alone. Or if you really have to, do a redraw afterwards. If
Xyou don't, you're bound to end up with some very confused screens.
X   Input is done by the getch() function, which inputs a character from the
SHAR_EOF
echo "End of part 1, continue with part 2"
echo "2" > s2_seq_.tmp
exit 0

sed 's/^X//' << 'SHAR_EOF' >> curses.doc
Xkeyboard and echoes it through addch() if echo is set. When using curses
Xyou may notice that, while performing output and other functions, the cursor
Xis switched off, when curses waits for input however the cursor is switched
Xon. Input can be done in either one of three modes : cooked, cbreak and raw.
XThese input modes are primarily introduced to maintain UN*X-compatability, but
Xthey do not work the same, so when porting UN*X-programs special care should
Xbe taken with any input routines. Moreover, you should not perform any input
Xthrough the stdio library, as they will surely echo something on the screen.
XUN*X-curses can handle this because it explicitly sets the echo of the terminal
Xoff, whereas Atari-curses only simulates this behaviour. So : any input only
Xthrough curses.
X   Cooked mode is supposed to be a line-oriented input interface. Using UN*X
Xand curses, cooked input can only be performed, when echo is not set, if it
Xis set cooked mode input turns to cbreak mode for the duration of the
Xinput call. Using Atari and curses, the same restrictions apply, with the
Xexception that the following characters have special meanings :
X
X+---------------+-------+-----------------------------------------+
X| character     | ASCII | action                                  |
X+===============+=======+=========================================+
X| control-C     |   $03 | do a Pterm(-1), i.e. exit immediately   |
X| control-H/BS  |   $08 | do a backspace, not beyond the beginning |
X|               |       | of the input-field.                     |
X| control-U     |   $13 | kill the entire input field             |
X+---------------+-------+-----------------------------------------+
X
X   Cbreak mode is supposed to be a single character oriented interface, with
Xwhich one can receive any character and have no special meaning attached to it.
XThe only exceptions are job-control characters like control-C ( interrupt ),
Xdelete ( kill the process ), control-Z ( suspend the process ) etc. On Atari
Xthis is translated in the following : all characters are received and only
Xcontrol-C has special meaning, which is : terminate the process.
X   Raw mode is also a single character interface and has no special processing
Xwhatsoever. The same holds for Atari.
X   Apart from the above-mentioned functions one should also note that
Xgetch() does not return a character, but a 32-bit value. For UN*X getch()
Xreturns an int, with ( apart from errors ) only the lower 7 or 8 bits set.
XOn Atari the same holds true for cooked mode, in cbreak mode the ASCII value
Xis returned in bits 0 to 7 and the scancode of the key in bits 16 to 23, raw
Xmode adds the keyboard shift state in bits 24 to 30. When entering a string
Xthrough getstr() or wgetstr() only the character portion of the long values
Xare retained.
```

X   Cleaning up is performed by the endwin() function. It releases the storage
Xacquired for curscr and stdscr, switches the terminal to its normal state
Xand puts the cursor in a reasonably comfortable place, i.e. at the bottom
Xof the screen. Note that any windows acquired through newwin() and subwin()
Xstill exist. They should be released from storage prior to calling endwin().
X
X
X   Constants, types and variables defined by curses.h.
X
X   The include file curses.h makes several constants, types and variables
Xavailable to the programmer. In this section something will be told about
Xtheir function and use.
X   The most important thing defined in curses.h is the data type WINDOW. This
Xdatatype is used by curses to maintain data for all windows. It has the
Xfollowing definition :
X
X#define   WINDOW   struct _win_st
X
Xstruct _win_st {
X   WORD   _cury, _curx ;
X   WORD   _maxy, _maxx ;
X   WORD   _begy, _begx ;
X   WORD   _flags ;
X   bool   _clear ;
X   bool   _leave ;
X   bool   _scroll ;
X   WORD   **_y ;
X   WORD   *_firstch ;
X   WORD   *_lastch ;
X   } ;
X
XThe internals of this structure are not normally to be accessed by the user.
XThis structure differs in three aspects from the UN*X-curses WINDOW structure.
XFirst of all the _y field is char in UN*X-curses, WORD in Atari-curses. This
Xhad been done to ensure that all characters in the Atari character set,
Xincluding all diacritical marks, can be displayed, whereas UN*X-curses will
Xonly display characters $20-$7f, or standard ASCII characters. As a matter
Xof act the Atari will display codes $00-$ff, with the exception of tabs,
Xlinefeeds and carriage returns. These have a special meaning.
X Each character can be in standout mode, if so desired. The other changes are
Xin the _firstch, _lastch fields. This reflects the updating algorithms used.
X   The fields have the following meaning : _cury and _curx are the current
Xcoordinates of the window, relative to the window's home, _begy and _begx. This
Xbeginning is relative to the terminals home position (0,0). _maxy and _maxx are
Xthe maximum values allowed for _cury and _curx. _flags is a bit-pattern
Xof several flags describing the structure of the window. _flags can have
Xseveral values OR'ed into it. _SUBWIN means that the window is a subwindow,
Xwhich indicates to delwin() that the character space cannot be freed. The
X_FULLWIN flag indicates that the window is a screen. _STANDOUT means that any
Xadded character is in standout-mode. UN*X-curses also defines the _ENDLINE
Xand _SCROLLWIN flags, they are defined in curses.h for compatability purposes,
Xbut Atari-curses does nothing with these values. The _clear field in the
XWINDOW structure is set when the next refresh on the window should generate

Xa clear screen sequence. Setting the clear flag for curscr will always
Xgenerate a clear screen sequence on any refresh. The _leave field is TRUE
Xif the windows current coordinates are to be set after the last character
Xchanged on the terminal after a refresh. The _scroll field is TRUE, if
Xscrolling is allowed. The _y field is a pointer to an array of pointers to
Xarrays of character values. These values are the actual contents of a window.
XThe lower 8 bits of a character value contain the real character value, the
Xupper 8 bits are used by curses internally. The _firstch and _lastch fields
Xare used by the updating algorithms of curses. Unless you know what you are
Xdoing you are not supposed to tamper with any of these values, curses supplies
Xa full set of functions to set any values which you want to be set.
X   After initializing curses you can be sure the following variables have been
Xset and initialized to their proper values. Some variables may even be set
Xprior to initializing curses. This is marked by a & in the table.
X
X+----------------+------------+---+
X| variable name | type | description |
X+================+============+===+
X| curscr | WINDOW * | curses idea of what the terminal screen looks |
X| | | like. |
X| stdscr | WINDOW * | Default screen for updates. |
X| Def_term | char * | Default terminal type. UN*X-compatability. |
X| My_term   & | bool | UN*X-compatability, does nothing. |
X| ttytype | char * | Full name of the terminal |
X| LINES   & | int | Number of ines curses thinks the terminal has |
X| | | normally 25, but may be changed, see text |
X| COLS   & | int | Number of columns curses thinks the terminal |
X| | | has, may be changed, see text. |
X| ERR | int | If this is set, curses had an internal error |
X| OK | int | If this is set, everything is gone right |
X+----------------+------------+---+
X
X   Also the following constants and macros are defined in curses.h :
X
X+----------------+---+
X| name | description |
X+================+===+
X| reg | storage class register, i.e. register int i => reg int i |
X| bool | boolean type, values can be TRUE or FALSE |
X| TRUE | boolean 'true' flag. |
X| FALSE | boolean 'false' flag. |
X+----------------+---+
X
X   Another difference between Atari-curses and UN*X-curses is that UN*X-curses
Xreads in a lot of variables described in /etc/termcap, no such thing exists
Xfor Atari, and is not needed anyway. However these variables are available
Xto the programmer in UN*X-curses, but not in Atari-curses. These include
Xthings like strings, which when output to the terminal cause some action to be
Xtaken, like the string VB, for a visible bell, or DM, enter delete mode. Care
Xshould be taken with UN*X-programs that perform such actions.
X
X
X   Description of individual functions.

```
X
X   The following is a description of all the individual routines, a lot of them
Xare defined as macros, notably those that take stdscr as the window and
Xfunctions that can be preceded by "mv". If such is the case, it is stated by
Xa '!' a little further on the line.
X
X   Output functions.
X
X
Xaddch(c)                   !
Xchar c ;
X
Xmvaddch(y,x,c)             !
Xint y,x ;
Xchar c ;
X
Xmvwaddch(win,y,x,c)        !
XWINDOW *win ;
Xint y,x ;
Xchar c ;
X
Xwaddch(win,c)
XWINDOW *win ;
Xchar c ;
X
X   Add the character c at the current coordinates of the window w. The
Xfollowing characters cause special processing : a newline ('\n') causes
Xthe line to be cleared to the end, and the current coordinates to be changed to
Xthe beginning of the next line if newline mapping is on, or to the next line
Xat the same column if newline mapping isn't on. A return ('\r') will move the
Xcursor to the beginning of the line on the window. Tabs ('\t') will be
Xexpanded into spaces into the normal tabstop positions of every eight
Xcharacters.
X
Xaddstr(s)                  !
Xchar *s ;
X
Xmvaddstr(y,x,s)            !
Xint y,x ;
Xchar *s ;
X
Xmvwaddstr(win,y,x,s)       !
XWINDOW *win ;
Xint y,x ;
Xchar *s ;
X
Xwaddstr(win,s)
XWINDOW *win ;
Xchar *s ;
X
X   Add the string s to the window at the current coordinates. Addstr() calls
Xaddch repeatedly to add the characters.
X
```

```
Xbox(win,vert,hor)
XWINDOW *win ;
Xchar vert, hor ;
X
Xmvbox(win,y,x,vert,hor)   !
XWINDOW *win ;
Xint y, x ;
Xchar vert, hor ;
X
X   Draws a box around the window using vert as the vertical drawing character
Xand hort as the horizontal drawing character.
X
Xclear()                   !
X
Xwclear(win)
XWINDOW *win ;
X
X   Reset the window to blanks. If win is a screen this will cause a clear
Xscreen sequence to be sent on the next refresh. The current coordinates
Xare also moved to the home-position (0, 0).
X
Xclearok(scr, boolf)       !
XWINDOW *scr ;
Xbool boolf
X
X   Sets the clear-flag for the screen scr to boolf. If boolf is TRUE this
Xwill generate a clear screen sequence on the next refresh. If it is FALSE
Xrefresh may be stopped from generating a clear screen sequence.
X
Xclrtobot()                !
X
Xwclrtobot(win)
XWINDOW *win ;
X
X   Clear the window from the current coordinates to the bottom. The current
Xcoordinates aren't changed.
X
Xclrtoeol()                !
X
Xwclrtoeol(win)
XWINDOW *win ;
X
X   Clear the window from the current coordinates to the end of the line. This
Xdoesn't change the current coordinates.
X
Xdelch()                   !
X
Xmvdelch(y,x)              !
Xint y, x ;
X
Xmvwdelch(win,y,x)         !
XWINDOW *win ;
Xint y, x ;
```

```
X
Xwdelch(win)
XWINDOW *win ;
X
X   Delete the character at the current coordinates. Characters on the same
Xline after the deleted character shift to the left and the last character
Xbecomes blank.
X
Xdeleteln()               !
X
Xmvdeleteln(y,x)          !
Xint y, x ;
X
Xmvwdeleteln(win,y,x)     !
XWINDOW *win ;
Xint y,x ;
X
Xwdeleteln(win)
XWINDOW *win ;
X
X   Delete the current line, move every line under it one line up and make the
Xbottom line blank. This doesn't change the current coordinates.
X
Xerase()                  !
X
Xwerase(win)
XWINDOW *win ;
X
X   Sets the entire window to blanks without setting the clear flag. See
Xclear(). The difference is that erase doesn't cause a clear screen sequence
Xto be generated.
X
Xinsch(c)                 !
Xchar c ;
X
Xmvinsch(y,x,c)           !
Xint y, x ;
Xchar c ;
X
Xmvwinsch(win,y,x,c)      !
XWINDOW *win ;
Xint y, x ;
Xchar c ;
X
X   Insert the character c at the current coordinates. each character after
Xthe current character shifts one place to the right and the rightmost character
Xfalls off.
X
Xinsertln()               !
X
Xmvinsertln(y,x)          !
Xint y, x ;
X
```

```
Xmvwinsertln(win,y,x)      !
XWINDOW *win ;
Xint y, x ;
X
X   Insert a line above the current line. Every line below will scroll down, and
Xthe bottom line will disappear. The inserted line will be blank. The current
Xcoordinates aren't chnaged by this function.
X
Xmove(y,x)                 !
Xint y, x ;
X
Xwmove(win,y,x)
XWINDOW *win ;
Xint y, x ;
X
X   Change the current coordinates of window win to (y, x). Whenever one of the
Xother output or input functions are preceded by "mv", this function is
Xexecuted first.
X
Xoverlay(win1,win2)
XWINDOW *win1, *win2 ;
X
X   The contents of win1 are placed on win2 at their respective starting
Xcoordinates. Those contents of win1, which would not fit in win2, are
Xdiscarded. Blanks on win1 leave the contents of win2 untouched.
X
Xoverwrite(win1, win2)
XWINDOW *win1, *win2 ;
X
X   The contents of win1 are placed on win2 at their respective starting
Xcoordinates. Those contents of win1, which would not fit in win2, are
Xdiscarded.
X
Xrefresh()                  !
X
Xwrefresh(win)
XWINDOW *win ;
X
X   Update the terminal screen with the contents of the window. Only those parts
Xcovered by the window will be updated. If the window is a screen and its
Xclear flag has been set, then a clear screen sequence will be generated.
X
Xmvstandend(y,x)            !
Xint y, x ;
X
Xmvwstandend(win,y,x)       !
XWINDOW *win ;
Xint y, x ;
X
Xstandend()                 !
X
Xwstandend(win)
XWINDOW *win ;
```

```
X
X   Stop putting characters onto win in standout mode.
X
Xmvstandout(y,x)           !
Xint y, x ;
X
Xmvwstandout(win,y,x)      !
XWINDOW *win ;
Xint y, x ;
X
Xstandout()                !
X
Xwstandout(win)
XWINDOW *win ;
X
X   Start putting characters onto win in standout mode, i.e. display inverted
Xcharacters.
X
X
X   Input functions.
X
X
Xcrmode()
X
X   Set the terminal in cbreak mode.
X
Xnocrmode()
X
X   Reset the terminal from cbreak mode into cooked mode.
X
Xecho()
X
X   Let the terminal echo characters on input.
X
Xnoecho()
X
X   Do not allow the terminal to echo characters on input.
X
Xgetch()                    !
X
Xmvgetch(y,x)               !
Xint y,x ;
X
Xmvwgetch(win,y,x)          !
XWINDOW *win ;
Xint y, x ;
X
Xwgetch(win)
XWINDOW *win ;
X
X   Get a character from the terminal and echo it on the window if echo is set.
XSee the section on programming with curses for more details about input modes.
XRemember getch() returns a 32-bit value, and not a char.
```

```
X
Xgetstr(s)                !
Xchar *s ;
X
Xmvgetstr(y,x,s)          !
Xint y,x ;
Xchar *s ;
X
Xmvwgetstr(win,y,x,s)     !
XWINDOW *win ;
Xint y, x ;
Xchar *s ;
X
Xwgetstr(win,s)
XWINDOW *win ;
Xchar *s ;
X
X   Get a string through the window win and put it in the string s, which is
Xassumed to be large enough to hold the data. To get the input it calls
Xgetch() repeatedly. The end of the input is designated by any of the
Xfollowing characters, a carriage return, a linefeed, a EOF or control-D, and
Xany character, which results in a '\0'. This character is stripped of the
Xstring and replaced by a null character to indicate the end of the string.
X
Xraw()
X
X   Set the terminal in raw input mode.
X
Xnoraw()
X
X   Set the terminal from raw into cooked input mode.
X
X
X   Miscellaneous functions.
X
X
Xdelwin(win)
XWINDOW *win ;
X
X   Deletes the window. All resources ( i.e. storage ) held by the window is
Xfreed for future use. As subwindows share their character space with another
Xwindow their character space is not freed. To delete a window with
Xsubwindows, you should first delete the subwindows and then the root window,
Xas any access to a subwindow after deletion of its parent window is a sure
Xroute to disaster.
X
Xendwin()
X
X   Clean up after curses. You should call this prior to termination of
Xyour program.
X
Xgetyx(win,y,x)            !
XWINDOW *win ;
```

```
Xint y,x ;
X
X   This macro puts the window current coordinates into the variables y and x.
XNote that you do not supply the address of the variables, as it is a macro.
X
Xinch()                    !
X
Xmvinch(y,x)               !
Xint y,x ;
X
Xmvwinch(w,y,x)            !
XWINDOW *w ;
Xint y, x ;
X
Xwinch(win)                !
XWINDOW *win ;
X
X   This macro returns the value of the character at the current coordinates
Xof the window. This does not change the contents of the window. The functions
Xmvinch() and mvwinch() are not supported by standard UN*X-curses, although
Xthey probably are by most UN*X-implementations.
X
Xinitscr()
X
X   Initialize curses. You should call this before any of the other calls.
X
Xleaveok(win,flag)
XWINDOW *win ;
Xbool   flag ;
X
X   Sets the _leave field of the window win to the value flag. If flag is
XTRUE then after an update on the terminal, the window's current
Xcoordinates will be set to the coordinates immediately after the last updated
Xcharacter. If flag is FALSE, then the cursor will be moved to the windows
Xcurrent coordinates. This flag is FALSE by default.
X
Xlongname(termbuf,name)
Xchar *termbuf, *name ;
X
X   Introduced for UN*X-compatability, it returns the contents of ttytype
Xin name, regardless of the contents of termbuf. This is not really consistent
Xwith UN*X-curses.
X
Xmvwin(win,y,x)
XWINDOW *win ;
Xint y, x ;
X
X   Move the home position of the window win, from its current coordinates to
Xthe coordinates specified in y and x. You cannot move a window off the
Xterminal screen, not even by a character.
X
XWINDOW *newwin(l,c,by,bx)
Xint l, c, by, bx ;
```

```
X
X   Create a new window with l lines and c columns starting at position (by,bx).
XIf either l or c is zero, then the dimension will be set to ( LINES - by ),
X( LINES - bx ). To get a screen, one would say newwin(0,0,0,0).
X
Xnl()
X
X   Set curses to newline mapping. This has consequences for adding the
Xcharacter '\n'. See addch() for these consequences.
X
Xnonl()
X
X   Set curses to do no newline mapping. This is the default. In UN*X-curses
Xyou get the fastest updates when you have no newline mapping, Atari-curses
Xdoesn't care about it.
X
Xscrollok(win,flag)
X
X   Set the _scroll field of the window win to flag. If flag is FALSE, the
Xterminal is not allowed to scroll, which is also the default.
X
Xtouchwin(win)
XWINDOW *win ;
X
X   Force curses to believe that the entire window has changed on the next
Xrefresh. This is useful for overlapping windows.
X
XWINDOW *subwin(win,l,c,by,bx)
X
X   Create a new window with a shared character space,as opposed to newwin(),
Xwhich allocates a new character space. See newwin() for more details about
Xthe l, c, by and bx parameters. The new window will share the character space
Xwith the window win. The subwindow must be smaller or the same size as
Xthe parent window. Changes on either window are reflected on the other window.
XMoving subwindows with mvwin() will create some pretty weird results, because
Xthe mapping of the subwindow to the parent window will tend to get displaced.
XFor instance, if I have a one character subwindow of a screen at coordinates
X(2,3) and if I move the subwindow to say (4,5), then if I change the character
Xon the subwindow at (4,5), the parent window will have changed at (2,3).
XI don't know whether this is UN*X-compatible, so take care here.
X
X
X   Detail functions.
X
X
X   These routines are at the core of UN*X-curses, and can be used on a
Xstandalone basis. Atari-curses has a very limited implemntation of this, so
Xif a program uses these, you'd better rewrite the whole thing. Most likely,
Xthe results of using these won't be the same on either of the two
Ximplementations.
X
Xmvcur(lasty,lastx,newy,newx)
Xint lasty, lastx, newy, newx ;
```

```
X
X   Move the terminals cursor from (lasty,lastx) to (newy,newx). Don't use it
Xwhen you use any of the screen routines.
X
Xscroll(win)
XWINDOW *win ;
X
X   Scroll the window upward one line. You don't normally want to do this.
X
X
X   Functions not supported by Atari-curses.
X
X
X   Several functions are not supported by Atari-curses, but are by UN*X-curses.
XThe names of these functions are given, as well as a reason for not
Ximplementing them.
X
Xmvprintw(), mvwprintw(), printw() and wprintw()
X
X   Performs a printf() on a window. I didn't want to implement this for two
Xreasons :
X1. This introduces compiler dependant code.
X2. A large overhead in coding is required. ( I'm very lazy. )
XThis omission can easily be gotten around with by inline replacement with :
X                 sprintf(a_string, format, ... ) ;
X                 addstr(a_string) ;
X
Xmvscanw(), mvwscanw(), scanw() and wscanw()
X
X  Performs a scanf() on a window. The same reasons apply here as the reasons
Xfor printw(). Replace it inline with :
X                 getstr(a_string) ;
X                 sscanf(a_string, format, ... ) ;
X
Xuncntrl()
X
X  Returns a string which is a representation of a character, nice debugging
Xfeature for UN*X-curses, but pretty meaningless for Atari-curses as
XAtari-curses can show any character.
X
Xgettmode()
X
X   A function called by UN*X-initscr(), it gets tty stats, which is
XUN*X-dependant anyway.
X
Xsavetty() and resetty()
X
X   Save and reset tty characteristics, used by UN*X-curses to initialize and
Xclean up respectively. Not necessary on Atari.
X
Xsetterm(name)
X
X   Set terminal characteristics to those of the terminal with name name.
```

```
XPretty useless on Atari.
X
Xtstp()
X
X   Function which is used in UN*X-curses to save the current state when a
Xprocess is put to sleep and to restore it when it is restarted. This is the
Xnormal catch for the signal SIGTSTP, which Atari users won't be able to receive
Xanyway.
X
X
X   Caveats and bugs.
X
X
X   There are differences between Atari-curses and UN*X-curses, especially in
Xthe area of input and the more detailed workings of curses. I will
Xprobably not change the workings of any input routines, because if I did
Xapplication programs wouldn't have any control over say function keys, cursor
Xkeys, etc. Such keys really make a difference in user friendly programs, so
XI'd better let a programmer have access to them. The more detailed workings
Xof curses are best left out too, as they concern themselves with multiple types
Xof terminals, where the Atari-curses is only fitted to a single
Xterminaltype, i.e. the Atari's VT52 emulation mode. Another problem
Xis possibly the low-resolution mode of the Atari, I don't have access to
Xa color monitor, so I wasn't able to test it in either medium or low-res.
XMedium probably works fine, but low-res ?. So, if you don't do anything too
Xfancy, you should be allright. One more thing : when you write portable
Xprograms, keep in mind that the Atari-curses is a lot faster than any
Ximplementation, which sends data over a terminal line. Comparing speeds
Xwill put any program on the Atari seemingly on a 50+ kilobaud line.
XAlso beware of funny characters, i.e. portable programs require character
Xranges between $20 and $7F, Atari-curses can and will handle a lot more. This
Xwarning should especially be heeded by say Germans and French, diacritical
Xmarks may screw things up real bad.
SHAR_EOF
chmod 0640 curses.doc || echo "restore of curses.doc fails"
sed 's/^X//' << 'SHAR_EOF' > curses.h &&

X
X
XNAME
X
X    curses - screen functions with "optimal" cursor motion
X
X
XDESCRIPTION
X
X   The functions in the curses-package give you an implementation of the
XUN*X-curses package for the Atari ST series computer. It allows you to do
Xterminal-oriented graphics of a crude nature. An image is kept of what the
Xcurrent screen looks like, while the user creates a new image. Refresh()
Xmust be called to make the current screen look like the one the user has
Xprepared. Initscr() must be called to initialize the package and endwin()
Xto clean up before exiting.
X

X   Ken Arnold.
X   The CURSES screen updating and cursor movement package : A collection
X   of C-functions for the Atari ST-series computers, R. van 't Veen.
X
XAUTHORS
X
X   UN*X-curses : Ken Arnold.
X   Atari-curses : Rene van 't Veen.
X
XFUNCTIONS
X
X   addch(c)   add a character to stdscr
X   addstr(s)   add a string to stdscr
X   box(win,v,h)   draw a box around a window
X   crmode()   set cbreak mode
X   clear()   clear stdscr
X   clearok(scr,f)   set clear flag for scr
X   cltobot()   clear to bottom on stdscr
X   clrtoeol()   clear to end of line on stdscr
X   delch()   delete a character
X   deleteln()   delete a line
X   delwin(w)   delete window w
X   echo()   set echo mode
X   endwin()   end window mode
X   erase()   erase stdscr
X   getch()   get a char through stdscr
X   getstr()   get a string through stdscr
X   getyx(w,y,x)   get current coordinates
X   inch()   get char at current coordinates
X   initscr()   initialize curses
X   insch()   insert a character
X   insertln()   insert a line
X   leaveok(w,f)   set leave flag for window w
X   longname(termbuf, name)   get a long terminal name
X   move(y,x)   move to (y,x) on stdscr
X   mvcur(ly,lx,ny,nx)   actually move the cursor
X   newwin(lines,cols,begin_y,begin_x)   create a window
X   nl()   set newline mapping on
X   nocrmode()   unset cbreak mode
X   noecho()   unset echo mode
X   nonl()   set newline mapping off
X   noraw()   unset raw mode
X   overlay(win1,win2)   overlay win1 on win2
X   overwrite(win1,win2)   overwrite win1 on win2
X   raw()   set raw mode
X   refresh()   make terminal look like stdscr
X   scroll(win)   scroll win one line up
X   scrollok(w,f)   set scroll flag for window win
X   standend()   leave standout mode
X   standout()   enter standout mode
X   subwin(win,lines,cols,begin_y,begin_x)   create a sub window

```
X   touchwin(win)                              change everything on win
X   waddch(win,c)                              add char to win
X   waddstr(win,s)                             add string to win
X   wclear(w)                                  clear w
X   wclrtobot(w)                               clear w to bottom of w

X        Notes for the Megamax Version of Curses
X
XThis version of curses compiles with the Megamax C compiler. A couple
Xof bug fixes were needed and the wgetstr routine was hacked quite a bit.
X
X
XNotes:
X
X1. The overlay() routine was renamed woverlay() to avoid a conflict with
X   the Megamax reserved word.
X
X2. The entire file was placed in an overlay because I needed the space.
X   You may want to get rid of the overlay line in curses.c depending on
X   what you're linking curses with.
```

```
X
X3. The routines printw() and scanw() are implemented in the usual brute-
X   force way since Megamax doesn't have varargs. These are at the end
X   of curses.c.
X
X4. Remember to change your init.c to get extra stack space.
X
X5. The file portab.h contains the definitions needed from the Alcyon
X   file of the same name. If you have a more complete version, use it.
X
X6. twinkle.tos isn't in this distribution because I wanted to post this
X   stuff as clear text.

Approved: koreth@panarthea.ebay.sun.com

Submitted-by: ncar.ucar.edu!dunike!onecom!wldrdg!hans (Johann Ruegg)
Posting-number: Volume 2, Issue 92
Archive-name: sozobon1.2/part01

     Here is part 1 of the Sozobon 1.2 release. This is an intermediate
release that only includes the compiler "hcc.ttp" and the optimizer "top.ttp".
The compiler has bug fixes and some minor preprocessor enhancements. The
optimizer is improved with a "registerizing" pass.

     Johann Ruegg
     ncar!dunike!onecom!wldrdg!hans

```
#! /bin/sh
# This is a shell archive.  Remove anything before this line, then unpack
# it by saving it into a file and typing "sh file".  To overwrite existing
# files, type "sh file -c".  You can also feed this as standard input via
# unshar, or by typing "sh <file", e.g..  If this archive is complete, you
# will see the following message at the end:
#        "End of archive 1 (of 9)."

#! /bin/sh
# This is a shell archive.  Remove anything before this line, then unpack
# it by saving it into a file and typing "sh file".  To overwrite existing
# files, type "sh file -c".  You can also feed this as standard input via
# unshar, or by typing "sh <file", e.g..  If this archive is complete, you
# will see the following message at the end:
```

```
#        "End of archive 4 (of 9)."
# Contents:  hcc/D2.C hcc/DECL.C hcc/EXPR.C hcc/TOK.C
# Wrapped by koreth@panarthea on Tue Oct 24 18:40:45 1989
PATH=/bin:/usr/bin:/usr/ucb ; export PATH
if test -f 'hcc/D2.C' -a "${1}" != "-c" ; then
  echo shar: Will not clobber existing file \"'hcc/D2.C'\"
else
echo shar: Extracting \"'hcc/D2.C'\" \(9938 characters\)

X *    of using this software, even if they result from defects in it.
X *
X *  tok.c
X *
X *  Basic level token routines
X *
X *  At this level, we return the following things:
X *       id's - strings of alpha-alnum
X *       integer constants
X *       float constants
X *       string constants
X *       multi-char tokens
X *
X *  We DONT know about:
X *       keywords
X *       #defined id's
X *       any other meaning of a name
X *
X *  Interface:
X *       call nxttok() to get next token
X *       look at 'curtok' for current token
X *       note that curtok.name points to a static area
X *         for ID or SCON
X *
X *       if EOF is seen, we call endfile() before
X *         giving up
X *
X *  Special flags:  (tk_flags)
X *       These special flags are needed for the pre-processor.
X *       All but TK_SEENL are 1-shot.
X *
X *       TK_SEENL - want to see \n
X *       TK_WS - want to see white space (for #define)
X *       TK_NOESC - dont do '\' escapes in strings
X *       TK_LTSTR - '<' is a string starter
X *       TK_ONLY1 - skip to token after \n  (for #if--)

X/*
X * The code in this file deals with "registerizing" local variables and
X * parameters. The general idea is to look for highly referenced local
X * variables and parameters and effectively turn them into register
X * variables automatically. Only the D registers are used, currently, so
X * for pointer variables, a manual "register" declaration in the source
X * code is actually better.
X *
X * We need to be certain of several things about a variable before placing
X * it in a register. It's address must not be taken, and it must not be
X * referred to through "aliases" (e.g. when casting to a shorter object).
X * It must be able to fit in a register. And to keep things like printf from
X * breaking, parameters can only be registerized if none of the parameters
X * have their address taken.
X *
X * The compiler makes this all possible by placing "hints" within the
X * generated assembly code. These hints appear as comments, but are parsed
X * by the optimizer, and the information is stashed away by calling addvar().
X * The hints give us the size and offset of each parameter and local variable.
X * Their names are also given, although that information isn't needed here.
X *
X * There are tradeoffs to be wary of when registerizing. If no register
X * variables exist yet, then "movem" instructions have to be added, requiring
X * more references to make this worthwhile. In the case of parameters, the
X * register has to be initialized from the stack. The four cases are:
X *
X *  Locals   w/ other regs:     1 reference  required
X *       no other regs:     4 references required
X *  Parms    w/ other regs:     2 references required
X *       no other regs:     6 references required
X *
X * The numbers above represent the break-even point based on a savings of
X * 2 bytes per reference, and the incremental cost of adding "movem" or
X * "move" instructions as needed.
X *
X * This optimizes for space only. To optimize for time, each reference would
X * be weighted based on the loop nesting level at which it occurs.
X */

Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 3, Info 1
Archive-name: intro

This is the first of two introductory articles about comp.sources.atari.st.
This one describes how to submit source to the newsgroup, where the
archive sites are, and how to contact them.  The companion article lists
all previously-published sources.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
   koreth@panarthea.ebay.sun.com
```

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to atari-sources@panarthea.ebay.sun.com. If you are on a UUCP-only site, you can send them to sun!ebay!panarthea!atari-sources. In Europe, send your submissions to Jan-Hinrich Fessel, the European submoderator of the group, at unido!atari-sources (or, if you're a masochist, atari-sources@unido.informatik.uni-dortmund.de.)

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, source without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a pain to separate them, and such submissions are invariably placed on the back burner. Sources should be submitted in "shar" format, plaintext and split up into reasonable (less than 50K) chunks, unless you don't have access to a shar program, in which case "arc" is all right.

Please inform me of any special system requirements, and what development environment was used, so that I can properly test your submission and label it when I post it.

Subject: The structure of comp.sources.atari.st articles

Each posting in comp.sources.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.sources.atari.st: sources and "information postings." They can be distinguished by the subject line:

  Subject: v03INF3: Index for Volume 1 and other info

This first word in the title identifies this as the third info posting of volume one. Similarly, the subject line shown below:

  Subject: v03i081: tossrc -- Source code to TOS

identifies this as the 81st source article in Volume 3. Large sources are broken up into smaller pieces, and have subject lines that look like this:

  Subject: v03i082: VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the

program is given on the keywords line.

```
  Keywords: MWC, Megamax, 1meg, high
```

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

```
  Alcyon  - Alcyon C (included with Atari developer's kit)
  MWC         - Mark Williams C
  Megamax - Megamax C
  Laser       - Laser C
  Lattice - Lattice C
  C       - Any C compiler
  OSI         - OSI Personal Pascal
  BASIC       - ST BASIC (this is not a joke!)
  uuencode    - program is uuencoded (uudecode required to unpack)
  arc         - program is archived (arc required to unpack)
  high        - high resolution
  medium  - medium resolution
  low         - low resolution
  1meg        - needs 1 meg of RAM
```

The first few lines of an article are auxiliary headers that look like this:

```
  Submitted-by: david@bdt.UUCP (David Beckmeyer)
  Posting-number: Volume 3, Issue 80
  Archive-name: micro-rtx
```

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

Please try to use this name when requesting that sources be mailed to you. Also, note that the "part number" given in the title, and the archive name given in the auxiliary header need not be identical.

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do try to limit filenames to eight characters whenever possible, though.

Subject: Reporting and tracking bugs and patches to postings

Most of the time, bugs and updates will be posted to comp.sys.atari.st.
Sometimes, "official" updates from the author will be posted submitted to
comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes
to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header.
Often there is a contact address in a README file, too. I do not maintain
the sources I moderate, so don't send your bug reports to me.

Subject: Listing of archive sites in no particular order

1. Site panarthea is running an archive server, which automatically answers
   mail requests. Send mail to archive-server@panarthea.ebay.sun.com with the
   word "help" in the message body for more information. Both the sources
   and binaries groups are archived on panarthea.
2. Unido is the European archive site. It's running an archive server
   similar to panarthea's; send "help" to unido!archive-server for more
   information. Unido archives both the sources and binaries groups.

If you know of additional sites which reliably archive comp.sources.atari.st
(or comp.binaries.atari.st, for that matter), please tell me so I can add
them to the list.

Archive-name: uurename

  Here's a tiny utility I wrote to help unpacking files from an archive server. You certainly know the problem: 'uud' expects all files except the first one to have a certain name, and that name is always different from the one you chose, no matter what you chose. With this program it's over: just name the files as you choose, for instance 'part01', 'part02',..., then type 'uurename part*', and you are done. All files have now their correct names, except for the ones that start a file (those not starting with 'begin part...' but just 'begin <permission> <name>'). All you have to do now is run uud on these 'partNN' files. Of course, this works only for files encoded with Dumas uuencode, and I have found some weirdly packed files that cause trouble, but it works most of the time, and even when it fails it does some useful work. After all, it's pretty trivial.

  The executable is there also for people without Sozobon C or Dlibs. The source compiled also on our BSD machine, but you must change the directory delimiter from '\' to '/'.

Hello net-world!

This archive contains some programs witch helps you to uudecode
```

files you got from the net on your UNIX-machine.

If you like it, send me a mail.

Stefan Focke   (focke@gmdzi.UUCP)

```
#!/bin/sh
# shar:  Shell Archiver  (v1.22)
#
#    Run the following text with /bin/sh to create:
#      liesmich.txt
#      readme.txt
#      uu_cat.c
#      uu_rename.c
#
sed 's/^X//' << 'SHAR_EOF' > liesmich.txt &&
X
XBei meinen Bemuehungen ein paar Programme vom Netz auf meinen ST zu holen,
Xstiess ich immer wieder auf Probleme:
X
XDateien, die ich vom "news reader" aus auf Platte geschrieben
Xhatte, waren, da der in der Uebersichtsliste angezeigte Titel nicht mit
Xdem uebereinstimmt, der hinter dem 'begin' der ua?-Datei steht, mit
Xeinem falschen Namen versehen. Das fuehrt dann dazu, dass wenn spaeter
Xauf dem ST "uudecode" ausgefuehrt wird, Programme, die aus meherern
XTeilen bestehen, nicht mehr zusammengesetzt werden koennen. Stattdessen
Xmuessen die Dateien erst umbenannt werden.
X
XDie weiteren Aufgaben der beiliegenden Programme sind, das uudecode
Xbereits auf der Unix-Maschine durchzufuehren und die entstehenden ARC-Files
Xauf Fehler zu ueberpruefen.
X
X
X
XBenutzung der Programme:
X
X- Vorbereitung: Compilieren der beiden C-Quellen
X  /* Dies sind meine ersten C-Programme. Kleine Schoenheitsfehler,
X     die alten C-Freaks die Haare zu Berge stehen lassen, koennen
X     daher durchaus enthalten sein. */
X  cc -o uu_rename.exe uu_rename
X  cc -o uu_cat.exe uu_cat
X  chmod u+x uu_rename
X  chmod u+x uu_cat
X
X- Speichern der einzelnen Teile eines vom Netz kommenden Programmes
X  unter einem beliebigen Namen. Die Extension sollte jedoch die Form
X  "ua?" haben.
X
X- Aufruf von uu_rename
X  Es werden alle "ua?"-Dateien bearbeitet. In den Dateien wird der hinter
X  "begin" stehende Dateiname gesucht und die Datei dementsprechend
X  umbenannt. Falls dieser Name nicht auf "ua?" endet, wird "uaa" als
```

```
X  Endung verwendet. Vor dem Umbenennen wird noch getestet, ob es die
X  Datei in die umbenannt werden soll bereits gibt. Falls dem so ist,
X  wird dies angezeigt und das Umbenennen nicht durchgefuehrt.
X
X- Aufruf von uu_cat
X  Da das uudecode meines UNIX-Rechners keine Dateien zusammensetzen kann,
X  also nicht mit den include-Anweisungen am Ende einer "ua?"-Datei arbeiten
X  kann, fuegt dieses Programm die Teile, aus denen die Datei besteht
X  zusammen. Es entsteht eine ".enc"-Datei, die die fuer "uudecode"
X  notwendigen Teile beinhaltete, sowie ein ".txt"-Datei, die Information,
X  die in der ".uaa"-Datei vor "table" steht, beinhaltet.
X  Nach dem Zusammensetzen wird uudecode aufgerufen. Anschliessend
X  wird auch "arc" mit den Optionen -v und -t ausgefuehrt.
X
X
XViel Erfolg
X
X   Stefan Focke     (focke@gmdzi.UUCP)
SHAR_EOF
chmod 0600 liesmich.txt || echo "restore of liesmich.txt fails"
sed 's/^X//' << 'SHAR_EOF' > readme.txt &&
X
XI had some Problems trying to get programs from the net.
X
XFiles I saved from the "news reader" often have wrong names, so "uudecode"
Xon my ST was not able to include all the files it needed. I had to
Xrename some files.
X
XThe other things the programs do are to uudecode the files on the UNIX-
Xmachine an to test, if the "ARC"-files are ok.
X
X
XHow to use:
X
X- Compile the C-sources
X  /* These are my first C-programs. So it is possible, that
X     they are not optimized */
X  cc -o uu_rename.exe uu_rename.c
X  cc -o uu_cat.exe uu_cat.c
X  chmod u+x uu_rename
X  chmod u+x uu_cat
X
X- Save the files coming from the net to your UNIX-disk. The name that you
X  give to the file has the only restriction, that the extension must
X  be of the form ".ua?"
X
X- Execute uu_rename
X  This program changes the names of all "ua?"-files to the name, witch
X  stands behind "begin" in this file. If a file with the new name exists
X  the program prints a message.
X
X- Execute uu_cat
X  This program puts a multi-part-file (uaa, uab, ) together to a
```

```
X  ".enc"-file. The text befor "table" in the "uaa"-file is written
X  into a ".txt"-file.
X  Then the batch-files executes uudecode and "arc -v" and "arc -t"
X
X
XGood luck
X
X  Stefan Focke   (focke@gmdzi.UUCP)

Archive-name: fract

this is just something i wipped up one day. i don't remember ever seeing
a mono mandelbrot generator (i dislike color :-), so here goes...enjoy.

it uses line A to plot pixels. should be portable to any bitmap computer
(i.e. sun, apollo, sgi, amiga, mac, pc, X11, ...). i tried to make the
portability things seperated for relative ease. i plan on doing an
X11 port soon (on a cray-2, to get some SPEED). i'd like to be able to
generate and display an image every few seconds (network is the limiting
factor :^). yafttms (yet another fly thru the mandelbrot set)...i will
also change the file to use the RLE-like scheme i mention somewhere...

in the spirit of a recent c.lang.c thread, the program uses some goto's!
included are some atari-specific line-A calls (like MWC libraries, i
think) which might be of general interest. written in alcyon as68.
i did not spend any time at all on the algorithm so expect 500+ second
runs. use "-i 50" for most everything (unless u run overnite). no
mouse support (you specify coord on command line).

NAME
     fract - Generate monochrome Mandelbrot set

USAGE
```

```
    fract [options]

       -i iterations (1000)         defines "convergence"
       -x xcenter (-1.0)        center of viewport
       -y ycenter (0.0)
       -r range (3.0)           size of viewport (width=height)
       -s scale (3)             0 to 3, 0=coarse 3=fine
       -v                   invert colors
       -a                   add contours
       -h                   hold screen before exit
       -o outfile           write results
       -f infile            view existing file (ignores -i,-x,-y,
                      -r,-s)

[defaults in parentheses. more help in man page, fract.6  -wjr]

this is a monochrome mandelbrot generator. it was originally written for
atari ST, but should port easily to amiga, pc, mac, sun, and X11. all you
really need is to be able to address and color a pixel. it may work on
color (med rez, i have not tried it) but you will only get the top half of
the image.

it generates images in a square only. on the st, this is 360x360 pixels
or about 129,000 pixels. it can take a while to generate an image so
it does it in 2 passes. the first pass is very coarse (45x45 "big" pixels).
you can break out of the calculation at any time with any keystroke.
you can also dump the binary data to a file (probably not portable for
non-680x0 systems because of byte order of shorts).

it works from a command line. you can set the iterations limit (default
is 1000 - much to large for most hacking). try "-i 50" for most work.
the default scaling is for finest image (single pixel). for a quicker
scan, try "-s 2" (arg for -s is 0 to 3, 0 is coarse, 3 is fine).

there are a couple of files to play with. these are binary data files
and unarc to around 250kB each. they are setup for atari ST using ffp
floats. there are only 3 floats stored and they are only used for annotation
so just skip them if you like. the files are in M0.ARC and M1.ARC. m0
is the full Mandelbrot set and m1 is a blowup of the area near the
tangency of the 2 big circles in the set. generate them with:

    fract -o m0 -i 50
    fract -o m1 -i 50 -x -0.9 -y -0.3 -r 0.13

Feel free to copy. Leave this file alone! No other restrictions on copying
or hacking. Use as you like.

NAME

fract - draw Mandelbrot fractals

SYNOPSIS

fract [options]

DESCRIPTION

Fract generates, stores, and displays fractal images from the Mandelbrot set. Fract was originally written for the Atari ST but it should be very easy to port to other hosts like Macintosh, Amiga, PC, Sun, and X. All you really need is to address a pixel and color it. It is meant for monochrome displays but can be made to work on color systems as well. On the Atari ST, it is meant for a shell but also works from the desktop.

Fract was designed to vary both the threshhold for convergence (or divergence) as well as the resolution of the display. The default is maximum for both which can take a long time to process. For most cases, you should be able to get by with iteration count of 50 to 100. The default coordinates plots the entire set. Use -x, -y, and -r to zoom in. Other default values will simply plot the values in the set black, outside white. The -a option allows you to alternate black and white contours for those values outside the set

(where color displays make the pretty pictures).

For resolutions higher than the lowest (-s 0), fract first calculates and plots the image for -s 0 -i 50, then calculates and plots the desired image. The first image is fairly fast on the Atari ST (about 30 seconds) and looks like "fat" pixels 8x8. This allows you to break the calculation if the image is not in range (with any key press). On non-unix systems with no interrupt signals, you can break the calculation with a keystroke after any pixel is done.

This program was based on an article in the December 1986 BYTE.

OPTIONS

The following command-line options are available:

-a Causes every other contour value to be drawn black. The default is to just plot the threshhold (-i value) and above.

-i iter

The default number of iterations dividing values in the set versus values outside the set. The default is 1000 though 50 or 100 should be sufficient for most things.

-x xcenter

The x coordinate of the viewing window. The default is -1.0.

-y ycenter

The y coordinate of the viewing window. The default is 0.0.

-r range

The x and y range of the viewing window. The default is 3.0.

-s scale
The scale factor. Possible values currently are 0, 1, 2, and 3. 0 is for coarse and 3 is for fine grain.

-v This toggles the "colors" (black to white and visa versa).

-h Hold display after plot (before return to the Atari desktop, for example).

-o outfile
Write results to file outfile.

-f infile
Display previous results from file infile.

PORTING

Fract was designed to be ported to other environments. Most of the code follows "normal" Unix conventions. The file I/O needs changing for porting to non-680x0 architectures, though it has even run on a Cray!

The following funtions are non-portable:

```
int  init ()       - initialize things
int  finish ()     - finish up
int  check_key ()  - check for a key press (interrupt)
int  wait_key ()   - wait for a key press
int  do_pixel ()   - plot a pixel of some color
int  do_line ()    - draw a line
int  cursor ()     - toggle cursor on/off
int  mv_cursor ()  - move cursor on screen
int  clr_screen () - clear screen, home cursor
long do_time ()    - for elapsed times
```

FILE FORMAT

The binary file format for saved images uses non-portable

formats (no binary data file is portable). Binary data is much more compact, however. It is a simple matter to write a simple program to convert to ASCII, however.

In general, words are 16-bit. Most of the data is integer words. The byte order is normal 68000 order (first byte read is most significant byte of word). The floating point data was originally using the Motorola Fast Floating Point format (FFP) largely because the development compiler is twice as fast with FFP versus IEEE. Note that the floating point data in the file is only for the textural display on the image and will not effect image display at all.

Here is the data format:

```
magic           (8 char, !<fract>)
machine         (1 16-bit word, 0=Atari, 1=Amiga, 2=PC,
                 3=Mac, 4=Sun,...)
version         (1 16-bit word, e.g. 100 or 0x00C8)
iter            (1 16-bit word)
scale           (1 16-bit word, 45, 90, 180, 360 pixels
                 per unit)
x               (1 32-bit FFP float)
y               (1 32-bit FFP float)
range           (1 32-bit FFP float)
data            (scale * scale 16-bit words)
...
```

.TH FRACT 6
.SH NAME
fract - draw Mandelbrot fractals
.SH SYNOPSIS
fract [options]
.SH DESCRIPTION
Fract generates, stores, and displays fractal images from the Mandelbrot set.
Fract was originally written for the Atari ST but it should be very easy
to port to other hosts like Macintosh, Amiga, PC, Sun, and X.
All you really need is to address a pixel and color it.
It is meant for monochrome displays but can be made to work on color
systems as well.
On the Atari ST, it is meant for a shell but also works from the desktop.
.PP
Fract was designed to vary both the threshhold for convergence (or divergence)
as well as the resolution of the display.
The default is maximum for both which can take a long time to process.
For most cases, you should be able to get by with iteration count of 50 to 100.
The default coordinates plots the entire set. Use -x, -y, and -r to zoom in.
Other default values will simply plot the values in the set black, outside
white.
The -a option allows you to alternate black and white contours for those
values outside the set (where color displays make the pretty pictures).
.PP
For resolutions higher than the lowest (-s 0), fract first calculates and
plots the image for -s 0 -i 50, then calculates and plots the desired image.
The first image is fairly fast on the Atari ST (about 30 seconds) and looks
like "fat" pixels 8x8.
This allows you to break the calculation if the image is not in range (with
any key press).
On non-unix systems with no interrupt signals, you can break the calculation
with a keystroke after any pixel is done.
.PP
This program was based on an article in the December 1986 BYTE.
.SH OPTIONS
The following command-line options are available:
```

.IP -a
Causes every other contour value to be drawn black. The default is to just plot the threshhold (-i value) and above.

.IP "-i iterations"
The default number of iterations dividing values in the set versus values outside the set. The default is 1000 though 50 or 100 should be sufficient for most things.

.IP "-x xcenter"
The x coordinate of the viewing window. The default is -1.0.

.IP "-y ycenter"
The y coordinate of the viewing window. The default is 0.0.

.IP "-r range"
The x and y range of the viewing window. The default is 3.0.

.IP "-s scale"
The scale factor. Possible values currently are 0, 1, 2, and 3. 0 is for coarse and 3 is for fine grain.

.IP -v
This toggles the "colors" (black to white and visa versa).

.IP -h
Hold display after plot (before return to the Atari desktop, for example).

.IP "-o outfile"
Write results to file outfile.

.IP "-f infile"
Display previous results from file infile.

.SH PORTING
Fract was designed to be ported to other environments. Most of the code follows "normal" Unix conventions. The file I/O needs changing for porting to non-680x0 architectures, though it has even run on a Cray!
.PP
The following funtions are non-portable:
.nf

```
int  init ()       - initialize things
int  finish ()     - finish up
int  check_key ()  - check for a key press (interrupt)
int  wait_key ()   - wait for a key press
int  do_pixel ()   - plot a pixel of some color
int  do_line ()    - draw a line
int  cursor ()     - toggle cursor on/off
int  mv_cursor ()  - move cursor on screen
int  clr_screen () - clear screen, home cursor
long do_time ()    - for elapsed times
```

.fi

```
.SH FILE FORMAT
The binary file format for saved images uses non-portable formats (no binary
data file is portable).
Binary data is much more compact, however.
It is a simple matter to write a simple program to convert to ASCII, however.
.PP
In general, words are 16-bit. Most of the data is integer words. The byte
order is normal 68000 order (first byte read is most significant byte of
word).
The floating point data was originally using the Motorola Fast Floating
Point format (FFP) largely because the development compiler is twice as
fast with FFP versus IEEE.
Note that the floating point data in the file is only for the textural
display on the image and will not effect image display at all.
.PP
Here is the data format:
.nf

magic           (8 char, !<fract>)
machine         (1 16-bit word, 0=Atari, 1=Amiga, 2=PC,
                 3=Mac, 4=Sun,...)
version         (1 16-bit word, e.g. 100 or 0x00C8)
iter            (1 16-bit word)
scale           (1 16-bit word, 45, 90, 180, 360 pixels
                 per unit)
x               (1 32-bit FFP float)
y               (1 32-bit FFP float)
range           (1 32-bit FFP float)
data            (scale * scale 16-bit words)
\&...

/*
 *   NAME:         fract - Generate monochrome Mandelbrot set
 *
 *   AUTHOR:       (c) 1989 Bill Rosenkranz
 *
 *            net: rosenkra%boston@hall.cray.com
 *            CIS: 71460,17
 *            GENIE:   W.ROSENKRANZ
 *
 *            Feel free to copy. Leave this comment alone! No other
 *            restrictions on copying or hacking. Use as you like.
 *
 *   MOTIVATION:   I don't ever remember seeing a monochrome fractal
 *            generator. I like this "zebra" effect with -a. Try:
 *
 *                 fract -a -i 50 -x -0.9 -y 0.3 -r 0.5
 *
 *            or unpack m1.arc and do:
 *
 *                 fract -a -f m1
 *
 *   COMPILE (ST): cc -o fract.ttp fract.c linea0.s linea1.s linea3.s
 *
 *   PORTABILITY:  Works with Alcyon 4.14 (Atari ST), should port easily
 *            to Mac, Amiga, Sun, PC, X, etc. except for file
 *            formats on non-680x0 architectures.
```

```
*
*           Floats in the files are only for text annotation.
*           Uses FFP floats not IEEE in files (3 numbers, stored
*           with putl). FFP is almost 2x faster. Here are formats
*           for FFP and IEEE:
*
*           FFP binary representation of 1.000000 is:
*
*              /---------------------------- mantissa (24 bits)
*              |                    /------- sign (1 bit)
*              |                    |   /--- exponent (7 bits)
*              |                    |   |
*           mmmmmmmmmmmmmmmmmmmmmmmmseeeeeee
*           10000000000000000000000001000001
*           ^
*           MSbit
*
*           mantissa: 10000000000000000000000
*           sign:     0
*           exponent: 1000001
*
*
*           IEEE binary representation of 1.000000 is:
*
*           /----------------- sign (1 bit)
*           |   /------------- exponent (8 bits)
*           |   |         /--- mantissa (23 bits)
*           |   |         |
*           seeeeeeeemmmmmmmmmmmmmmmmmmmmmmm
*           00111111100000000000000000000000
*           ^
*           MSbit
*
*           sign:     0
*           exponent: 01111111(127)
*           mantissa: 00000000000000000000000(0)
*
*
*           Note: getw() must read 16-bit int and getl() must
*           read 32-bit int from stream. putw() and putl() should
*           work with the same sizes, respectively.
*
*           For anyone hacking on the file stuff, do us all a
*           favor and not try to write structures to the file.
*           binary is bad enough. Binary structures is impossible.
*
*   NOTES:       Rough timings for scale=FINE, default x,y,range
*           (8 Mhz atari ST):
*
*           -i   time
*           -----    -------
*           10   560 sec
*           50   1350 sec
```

```
 *            100  2280 sec
 *            (-i 100 on a cray-2 is about 2 sec, no hand opt *8^)
 *
 *            The more points in the set in the zoom range, the
 *            longer it takes because it has to go to max_iter.
 *            The algorithm is pretty week and could be beefed up.
 *            This was a one day hack.
 *
 *            I was thinking of some sort of RLE-like encoding of
 *            data. How about if MSbit set, that word tells now
 *            many of the next word gets repeated? So rather than:
 *
 *                 .... 0001 0001 0001 0001 0001 0001 0005 ....
 *
 *            you use:
 *
 *                 .... 8006 0001 0005 ....
 *
 *            This takes much longer to read and write a file.
 *
 *            Make as a .ttp and use -h to hold for desktop or to
 *            take a snapshot.

XNote:  Each window has its own file buffer.  This file buffer is composed
Xof a linked list of blocks.  addmember() adds a new block to the end of the
Xlist of blocks in the buffer, or puts the first block into the list if
Xthere were no blocks in the list.  The size of the blocks in the buffer
Xis set with the globabl constant BLOCKSIZE.  Using a linked list of blocks
Xfor a buffer simplifies memory management and speeds up inserts and deletes
Xsince only the block containing the data in question need be modified.
Xinsert_member() inserts a block into the linked list and splits the data
Xin the previous block between it and the new block.  This leaves two half
Xfilled blocks for insertions.  dispose_member() deletes a block out of the
Xlist....  happens when all of the data in a block is deleted or cut.
Xdispose_buf() will delete the entire file buffer by deleting all of its
Xblocks

X   XXED copyright Jim Charlton 1989. XXED is freely distributable
Xprovided that this file is distributed with the source and executable
Xcode. No-one may charge a fee for the executable or source code, nor for
Xdistribution of this code.
X
X   Version 1.0 is the first release of this program and all reports of
Xproblems, bugs or suggestions for improvements should be forwarded to the
Xaddress given above.
X
X   No garantees, written or implied are made as to the suitability of
Xthis program for any particular purpose. Anyone who uses it, does so at
Xtheir own risk.
X
X   The source code was compiled using Megamax Laser C version 2.0. The
Xprogram was tested primarily on a 1040ST (Nov 1985 ROMS), monochrome and
Xhas not been extensively tested in colour, although it should work in
Xcolour.
X
X   The file FNCTLST.DOC contains a list of all of the functions defined
Xin the source code with very brief descriptions of what they do. While
Xthe source code is not extensively documented, it should be readable by
Xan experience C programmer. The basic program structure is modelled after
Xthe example code that comes with the Laser C compiler. Each file has its
Xown window and workspace. A linked list is used to keep track of the
Xopen windows. Each window has a file buffer which is a linked list of
Xblocks. Using linked lists makes memory management easier and speeds
Xup inserts and deletes.
X
X   The following very brief instructions should suffice to enable you to
Xuse the program.
X
XFeatures:
X   1.   Can create and edit files of any format.
X   2.   Can insert or replace bytes using hexadecimal or ascii input.
X   3.   Displays simultaneously in hex and ascii.
X   4.   Can cut, copy, paste and erase.
X   5.   Can search or search/replace on hex or ascii strings.
X   6.   Full GEM interface. Open up to 7 files in individual windows.
X
XInstructions:
X   Start the program and inspect the menu entries. Under file you can
Xopen an existing file or start editing a new file. When you open a file,
Xa copy of the file is made in ram which can be edited. This program is
Xnot a disk editor, and does not change the copy of the file on the disk
Xuntil you specifically save the file. Having opened a file, you can edit
Xin hexadecimal or ascii mode. The input mode is switched by clicking the
Xmouse in the hex or ascii display area. You can either insert or replace
Xbytes. The insert/replace mode is toggled with the insert key or the edit
Xmenu. Selected text can be marked using the cursor and the mark menu or
Xby dragging the mouse in either the hex or ascii display area (Only the
Xhex display is marked). The marked area can be copied or cut to a
Xcutbuffer, or erased using the edit menu. Text which has been copied or
Xcut to the cutbuffer can be pasted into the file at the cursor position

```
Xusing the paste command in the edit menu.  You can search forwards and
Xbackwards for ascii strings from the search menu.  You can also search and
Xreplace from the search menu.  You can use the cutbuffer as either the search
Xor replace pattern.  In this way you can also search or search/replace on
Xhex strings.  The info menu provides the length of the file and the
Xposition of the cursor in the file.  The print option under the file menu
Xwill print the file in the active window or the marked text (if any) in the
Xactive window.  Pressing any key during printing will abort printing.

Archive-name: nroff/part01

this is source for a partially complete nroff(1) for atariST TOS. it should
port to minix-ST (it runs on 4BSD).

nroff (TOS) v0.90 ALPHA 11/12/89 wjr
-----------------------------------

This is a preliminary release of a version of nroff for atariST. It was
written under TOS, USG, and 4BSD but should port easily to Minix ST as
well. I doubt it will be easy to port to Minix PC unless the static arrays
are changed to be malloc'd.

Much of this works. The things that don't are all the hard things (natch):
diversions, traps, conditionals, etc. Font switching, underlining,
etc. are limited to reverse video on the screen, though stdout will
contain underlines as "_^H" for printers.

There is a crude man package included (tmac.an) which is not right
but needs diversions to become right. It should handle most man tasks,
though, except .IP and similar commands.

For porting info, look in nroff.h and the makefile. I have to fix
my ctime(3) so as implemented, it is slightly incorrect. The standard
dri/alcyon libraries are limited so I have my own extensions. Only
ctime(3) and getenv(3) are used, as I recall. If you use dLibs or MWC
you should be in good shape (SOMEDAY I'll switch to dLibs). Minix should
also have no problems. As it stands, I have a >300k stack set up (plenty
of memory on a Mega4 *8^) and this should be fine for a 1040ST. If it
is not, and you don't/can't recompile, consider dumping some of your DA's.
You could also binary edit the executable, looking for a long in the bss
segment which defines the stack size for the startup (I use a hacked up
gemstart.s). Look for 0x00055555L long near the end (NB: 0x55 is "U").
I think is is at offset $a9e0 in the file.

If you do hack away, I would appreciate you sending me the changes
so I can keep this centralized. Eventually, this may be good enough
for FSF (GNUroff?).

@.TH NROFF 1 "Commands Manual" "Version 1.0" "Sept 1989"
@.SH NAME
nroff - text processor

@.SH SYNOPSIS
\fInroff\fR [\fIoptions\fR] \fIfile\fR [\fI...\fR]
```

```
@.SH DESCRIPTION
\fINroff\fR is a text processor and formatter based on the design
provided in "Software Tools" by Kernighan and Plauger.
It has been modified to closely resemble the Unix(tm) nroff command.
The text and commands found in the \fIfile(s)\fR
are processed to generate formatted text.
Note that one (and only one) of the files can be "-" which reads
input from stdin at that point.
The output always goes to stdout which can be redirected by the shell.
@.\" Using the command line option \fI-l\fR will cause the output to
@.\" be sent to the printer instead.
The \fI-o\fR option lets you redirect error output to the specified
file rather than stderr.
Debugging information always goes to the file "nroff.dbg" and is
generally used only for program development.

@.SH OPTIONS
The following command line options are available:
@.nf

\fI-a\fR            Changes font (not implemented).

\fI-b\fR            Allows backspaces to appear in the output
              text  when  underlining  or overstriking.
              This  has  the  same  effect  as  the \fI\.bs\fR
              command with a non-zero argument.

\fI-d\fR            Set debug mode.

\fI-h\fR            Hold screen before desktop (TOS only).

\fI-l\fR            Send output to printer (not implemented).

\fI-m<name>\fR      Process  macro  file  tmac.<name>.   Thus
              -man would cause the file  tmac.an  to be
              loaded. Note that files processed in this
              way should contain only macro definitions,
              no  immediate output  should be generated
              from this file (see ENVIRONMENT).

\fI-o\fR \fIfile\fR       Set error log file (default is stderr).

\fI-po<n>\fR        Shift output right n spaces (like \fI.po\fR).

\fI-pn<n>\fR        Initial page number (like \fI.pn\fR).

\fI-v\fR            Prints the version information to stdout.

\fI+<n>\fR          Causes output to start with page n.

\fI-<n>\fR          Causes output to stop after page n.
```

```
\fI-\fR             Input from stdin.

@.fi

@.SH ENVIRONMENT
Nroff recognizes the following environment variables from the shell:
@.br
@.in +6

@.XT TMACDIR
An alternate directory to find the files tmac.* ("." for example).
The default is c:\\lib\\tmac under TOS.
@.br
@.in -6

@.SH FILES
@.nf
c:\\lib\\tmac\\tmac.*      predefined macros (see ENVIRONMENT)
nroff.dbg               debugging output
stderr                  default error output stream
stdout                  output stream

@.fi

@.SH COMMANDS
Commands typically are distinguished by a period in column one
of the input
followed by a two character abbreviation for the command funtion.
The abbreviation may then be followed by an optional numeric or
character argument.
The numeric argument may be an absolute value such as setting
the right margin to a particular column, or the argument may be
preceded by a plus sign or a minus sign to indicate that the
parameter should be modified relative to a previous setting.
The following commands are recognized (those marked "extension"
are requests added to the basic set):
@.br
@.in +6

@.XT .bo (extension)
causes the following lines of text to appear in boldface.
The optional argument specifies the number of lines to be typed in boldface.
Boldface and underlining are mutually exclusive features.
The appearance of a boldface command will cause any underlining to cease.

@.XT .bp (extension)
causes succeeding text to appear at the top of a new page.
The optional argument specifies the page number for the new page.
The initial value is one and the default value is one more than
the previous page number.

@.XT .br
causes succeeding text to start on a new line at the current left margin.
```

There is no numeric argument for this command.

@.XT .bs (extension)
enables or disables the appearance of backspaces in the output text.
Underlining and boldface options are implemented by inserting
character - backspace - character combinations into the output buffer.
This is fine for devices which properly recognize the backspace character.
Some printers, however, do not recognize backspaces, so the option is
provided to overprint one line buffer with another.
The first line buffer is terminated with just a carriage return
rather than the carriage return - linefeed combination.
A zero argument or no argument to the backspace command removes
backspaces from the output.
A non-zero argument leaves them in the output.
The default is to remove backspaces.

@.XT .cc
changes the \fInroff\fR command character to that specified by the
character argument.
If no argument is provided, the default is a period.

@.XT .ce
causes the next line of text to appear centered on the output.
The optional argument specifies if more than one line is to be centered.

@.XT .c2
changes the \fInroff\fR no break character to that specified by the
character argument.
If no argument is provided, the default is a single quote.

@.XT .de
causes all text and commands following to be used to define a macro.
The definition is terminated by a \fI\.en\fR command or the
default \fI\.\.\fR terminator.
The first two characters of the argument following the \fI\.de\fR
command become the name of the new command.
It should be noted that upper and lower case arguments are considered different.
Thus, the commands \fI\.PP\fR and \fI\.pp\fR could define two different macros.
Care should be exercised since existing commands may be redefined.
@.PP
A macro may contain up to ten arguments.
In the macro definition, the placement of arguments is designated by the
two character sequences, $0, $1, ... $9.
When the macro is invoked, each argument of the macro command line is
substituted for its corresponding designator in the expansion.
The first argument of the macro command is substituted for the $0
in the expansion, the second argument for the $1, and so forth.
Arguments are typically strings which do not contain blanks or tabs.
If an argument is to contain blanks, then it should be surrounded by
either single or double quotes.

@.XT .cu
causes the next line(s) of text to be continuously underlined.

Unlike the underline command (see \fI\.ul\fR) which underlines only
alphanumerics, continuous underlining underlines all printable characters.
The optional argument specifies the number of lines of text to underlined.
Any normal underlining or boldface commands currently in effect will be
terminated.

@.XT .ec
changes the \fInroff\fR escape character to that specified by the
character argument.
If no argument is provided, the default is a backslash.

@.XT .ef (extension)
specifies the text for the footer on even numbered pages.
The format is the same as for the footer command (see \fI\.fo\fR).

@.XT .eh (extension)
specifies the text for the header on even numbered pages.
The format is the same as for the footer command (see \fI\.fo\fR).

@.XT .en (extension)
designates the end of a macro definition.

@.XT .fi
causes the input text to be rearranged or filled to obtain the maximum
word count possible between the previously set left and right margins.
No argument is expected.

@.XT .fl
causes the output buffer to be flushed immediately.

@.XT .fo (extension)
specifies text to be used for a footer.
The footer text contains three strings seperated by a delimiter character.
The first non-blank character following the command is designated
as the delimiter.
The first text string is left justified to the current indentation
value (specified by \fI\.in\fR).
The second string is centered between the current indentation value
and the current right margin value (specified by \fI\.rm\fR).
The third string is right justified to the current right margin value.
The absence of footer text will result in the footer being printed as
one blank line.
The presence of the page number character (set by \fI\.pc\fR) in the footer
text results in the current page number being inserted at that position.
Multiple occurrances of the page number character are allowed.

@.XT .ft
changes the current font.
The choices are R (Times Roman), I (Times Italic), B (Times Bold),
S (math special), and P used to request the previous font.
P resets the next previous font to be the one just changed, amounting to a swap.

@.XT .he (extension)

specifies text to be used for a header.
The format is the same as for the footer (see \fI\.fo\fR).

@.XT .in
indents the left margin to the column value specified by the argument.
The default left margin is set to zero.

@.XT .ju (extension)
causes blanks to be inserted between words in a line of
output in order to align or justify the right margin.
The default is to justify.

@.XT .ll
sets the current line length. The default is eighty.

@.XT .ls
sets the line spacing to the value specified by the argument.
The default is for single spacing.

@.XT .m1 (extension)
specifies the number of lines in the header margin.
This is the space from the physical top of page to and including
the header text.
A value of zero causes the header to not be printed.
A value of one causes the header to appear at the physical top of page.
Larger argument values cause the appropriate number of blank
lines to appear before the header is printed.

@.XT .m2 (extension)
specifies the number of blank lines to be printed between
the header line and the first line of the processed text.

@.XT .m3 (extension)
specifies the number of blank lines to be printed between
the last line of processed text and the footer line.

@.XT .m4 (extension)
specifies the number of lines in the footer margin.
This command affects the footer the same way the \fI\.m1\fR
command affects the header.

@.XT .ne
specifies a number of lines which should not be broken across a page boundary.
If the number of lines remaining on a page is less than the
value needed, then a new output page is started.

@.XT .nf
specifies that succeeding text should be printed without
rearrangement, or with no fill.
No argument is expected.

@.XT .nj (extension)
specifies that no attempt should be made to align or justify the right margin.

No argument is expected.

@.XT .nr
causes the value of a number register to be set or modified.
A total of twenty-six number registers are available designated
\\na through \\nz (either upper or lower case is allowed).
When the sequence \\nc is imbedded in the text, the current value
of number register c replaces the sequence, thus, such things as
paragraph numbering can be accomplished with relative ease.

@.XT .of (extension)
specifies the text for the footer on odd numbered pages.
The format is the same as the footer command (see \fI\.fo\fR).

@.XT .oh (extension)
specifies the text for the header on odd numbered pages.
The format is the same as the footer command (see \fI\.fo\fR).

@.XT .pc
specifies the page number character to be used in headers and footers.
The occurrance of this character in the header or footer text
results in the current page number being printed.
The default for this character is the percent sign (%).

@.XT .pl
specifies the page length or the number of lines per output page.
The default is sixty-six.

@.XT .po
specifies a page offset value.
This allows the formatted text to be shifted to the right by
the number of spaces specified.
This feature may also be invoked by a switch on the command line.

@.XT .pn
changes the page number of the current page and all
subsequent pages to its argument. If no argument is given,
the command is ignored.

@.XT .so
causes input to be retrieved from the file specified
by the command's character string argument.
The contents of the new file are inserted into the output
stream until an EOF is detected.
Processing of the original file is then resumed.
Command nesting is allowed.

@.XT .sp
specifies a number of blank lines to be output before
printing the next line of text.

@.XT .ti
temporarily alters the indentation or left margin value for a single

```
succeeding input line.

@.XT .tl
specifies text to be used for a page title.
The format is the same as for the header (see \fI\.he\fR).

@.XT .ul
causes the next line(s) of text to be underlined.
Unlike the \fI\.cu\fR command, this command causes only alphanumerics
to be underlined, skipping punctuation and white space.
Underline and boldface are mutually exclusive.
@.br
@.in -6

@.SH ESCAPE SEQUENCES
Escape sequences are used to access special characters (such as Greek
letters) which may be outside the normal printable ASCII character set.
The are also used to toggle certain actions such as font selection.
@.PP
@.ne 5
The escape sequences include:
@.sp
@.eo
@.nf
     \\          backslash character
     \"          beginning of comment
     \(xx        special character named xx
     \fc         font change (c = R,I,B,S,P)
     \nx         interpolate number register x
@.fi
@.PP
@.ne 5
The special characters include:

Archive-name: kbext410

This is the latest version (4.10) of KBEXT (keyboard extension).
Put KBEXT4.PRG into the AUTO folder, or start it at any time from the
desktop (but only once a session). It will establish a memory resident
extension to the keyboard interrupt handler, which allows in addition to
the NORMAL, SHIFT and CAPS-LOCK keyboard tables also ALT and ALT-SHIFT
keyboard tables to be used, thus allowing more than 128 additional
characters to be entered directly from the keyboard pressing the ALT
key. ALL KEYBOARD TABLES (INCL. THE NON-ALT) OVERRIDE ANY OTHER USER- OR
PROGRAM-DEFINED TABLE, I.E. XBIOS CALL 16 (KEYTBL) HAS NO EFFECT! COLD
```

BOOT is triggered by pressing CTRL-ALT-rightSHIFT-DEL, WARM BOOT by
pressing CTRL-ALT-DEL (it's interesting to hear TOS 1.4 has this already
built-in :-)).
KBEXT4 contains also a screen saver, which disables the screen 10
minutes after the last mouse/keyboard/midi event; KBEXT3 is without
screen saver.
The program may be freely used, copied and modified, totally at your own
risk and responsibility, and only for non-profit use.

Enjoy,   Roland Waldi, BD05 @ DKAUNI2.BITNET

```
#!/bin/sh
# shar:  Shell Archiver  (v1.22)
#
#    Run the following text with /bin/sh to create:
#      KBEXT.TXT
#      KBEXT3.ASM
#      KBEXT4.ASM
#
sed 's/^X//' << 'SHAR_EOF' > KBEXT.TXT &&
XKBEXT.PRG (Version 2.02-87/09, 3.10-89/11, 4.10-89/11)
X-------------------------------------------------------
X
XPut KBEXT.PRG into the AUTO folder, or start it at any time from the
Xdesktop (but only once a session). It will establish a memory
Xresident extension to the keyboard interrupt handler, which allows
Xin addition to the NORMAL, SHIFT and CAPS-LOCK keyboard tables also
XALT and ALT-SHIFT keyboard tables to be used, thus allowing more than
X128 additional characters to be entered directly from the keyboard
Xpressing the ALT key. For use with some programs using ALT+key
Xcombinations as control keys, use ALT+CTRL+key instead.
X
XKBEXT version 3.xx does the same, but all keyboard tables (incl. the
Xnon-ALT) override any other user- or program-defined table, i.e. XBIOS
Xcall 16 (keytbl) has no effect! The version 2.xx only initializes the
XTOS keyboard table to its own copies, using keytbl itself, which may be
Xreplaced or abandoned later by any other program.
X
XKBEXT version 4.xx is KBEXT 3.xx plus a screen saver, which disables
Xthe screen 10 minutes after the last mouse/keyboard/midi event.
XKBEXT version 4.02 adds a cold boot by pressing CTRL-ALT-rightSHIFT-DEL.
XKBEXT version 4.10 adds a warm boot by pressing CTRL-ALT-DEL.
X
XIf you use KBEXT.PRG as it is, you will get the following keyboard
Xlayout (which is close to the US and GB version of the ATARI keyboard
Xfor the non-ALT keys):
X
XNORMAL:
X

X
XThere are at least two ways to change the keyboard assignment:
X
X1. Change the keyboard tables in KBEXT.ASM and reassemble the
X   program. You may have to change some control statements
X   to fit your assembler's requirements, but the program is
```

```
X   written to make changes even to MEGAMAX-C-Inline-Assembler
X   not too hard (Use a minimal INIT.C here to save memory and
X   to provide basepage information).
X
X2. Use any PD keyboard-changing program, which allows to
X   save a xxx.KBD file (check if it has 384 bytes), e.g.
X   MOBZKEY.ACC, and make two files: DEFAULT.KBD for the
X   normal keyboard assignment, and ALT.KBD with the
X   unshifted and shifted ALT keyboard assignments (don't
X   change the caps-lock table here, you will need CAPS LOCK
X   to type into the file-selector box, since MOBZKEY changes
X   the keyboard assignment immediately!).
X
X   Put these two files into the \AUTO\ folder of your boot disk,
X   if you use KBEXT at boot time, or into the \AUTO\ folder of
X   your working disk containig KBEXT(4).PRG otherwise.
X   From now on the tables in these datasets will be used, when KBEXT
X   is run.
X
X3. A third possibility would be to make the files DEFAULT.KBD and
X   ALT.KBD mentioned in (2) by a separate program, e.g. a file monitor
X   etc. The format of a KBD file is simply 3 times 128 bytes of the
X   keyboard tables (one byte per character) for normal, shifted and
X   caps-lock. The key numbers (hexadecimal) are:
X
X3B /3C /3D /3E /3F /40 /41 /42 /43 /44 /
X
X01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 29  0E  62    61  63 64 65 66
X0F  10 11 12 13 14 15 16 17 18 19 1A 1B    53  52 48 47  67 68 69 4A
X[1D] 1E 1F 20 21 22 23 24 25 26 27 28   1C 2B  4B 50 4D  6A 6B 6C 4E
X[2A](60)2C 2D 2E 2F 30 31 32 33 34 35 [36]               6D 6E 6F 72
X   [38]  -------39------  [3A]                           70   71
X
X   Note that US keyboards don't have the key (60). You should assign
X   0 to all function keys, and to the positions that do not belong
X   to any key. Key number redefinitions used by TOS with the ALT key are
X   automatically taken into account by KBEXT, after reading the ALT.KBD
X   file; so the numbers given above should be used for all 5 tables.
X
X4. Finally, you can also patch the program code: you find all tables
X   contiguous after "KBEXT/RW" in the order normal - shift - caps -
X   alt - shift/alt. You can use your favourite disk-/file monitor
X   to change these tables in KBEXT(4).PRG.
X
XThe program may be freely used, copied and modified, totally at your
Xown risk and responsibility, and only for non-profit use.
X
XEnjoy,                Roland Waldi, BD05 @ DKAUNI2.BITNET

X;*
X;* here are the keyboard tables for normal, SHIFT,
X;*                                   and normal with CAPS LOCK
X;*                                   ALT, ALT&SHIFT
X;* you find them in the compiled program after the tag "KBEXT/RW"
X;*
X;* to change the keyboard layout, use the "normal" table as a
X;* guide for the keys (the layout is for a UK keyboard)
X;* and insert the ATARI/ASCII codes of the characters you want.
X;* NOTE:
X;* with ALT, the positions 02 ('1') ... 09 ('8') move to
X;* 78 ... 7F,
X;* and 0A ('9') ... 0D ('=') to 00 ... 03 (should be 80 ... 83)
X;* these rearrangements are done BY THE PROGRAM, so: fill the
X;* tables according to the normal keycode position.

Submitted-by: mlake@irscscm.ucb.com (Marshall Lake)
Posting-number: Volume 3, Issue 12
```

```
Archive-name: cal

The enclosed source code is a UNIX-like calendar program.
It was developed using MWC.  The documentation is self-contained.

-------CUT-------
#! /bin/sh
# This is a shell archive.  Remove anything before this line, then unpack
# it by saving it into a file and typing "sh file".
# Contents:  ./cal.c
if test -f './cal.c' -a "${1}" != "-c" ; then
  echo shar: Will not clobber existing file \"'./cal.c'\"
else
echo shar: Extracting \"'./cal.c'\" \(12751 characters\)
sed "s/^X//" >'./cal.c' <<'END_OF_FILE'
/*
    cal:  a UNIX-like calendar program
          format:  cal [-nihf filename]
                   where n = the number of days to look ahead including
                             today, max 99, default 2
                         filename = file to look for instead of cal.txt

                    i  return information regarding CAL
                    h  return help with regard to CAL
                    f  use the following specified file as input to CAL
                       instead of cal.txt

    RETURNS:
    0 - CAL terminated successfully
    1 - bad calling format
    2 - "count of days" greater than 99 or longer than 2 positions
    3 - "count of days" = 0
    4 - cal.txt file not found
    5 - record in cal.txt greater than 1000 characters
    6 - information only requested (i and/or h options)

this is a port of the dhrystone bm, v2.0, i found on the MIPS BBS. when
run on my mega4, compiled with alcyon 4.14, it ran at about 719. see
the file OUT.ST for the results of that run.

 *
 *                  "DHRYSTONE" Benchmark Program
 *                  -----------------------------
 *
 *  Version:    C, Version 2.0
 *
 *  Date:       March 3, 1988
 *
 *  Author:     Reinhold P. Weicker
 *                      Siemens AG, E STE 35
 *                      Postfach 3240
 *                      8520 Erlangen
 *                      Germany (West)
 *                              Phone:  [xxx-49]-9131-7-20330
 *                                      (8-17 Central European Time)
 *                              Usenet: ..!mcvax!unido!estevax!weicker
 *
 *              Original Version (in Ada) published in
 *              "Communications of the ACM" vol. 27., no. 10 (Oct. 1984),
 *              pp. 1013 - 1030, together with the statistics
 *              on which the distribution of statements etc. is based.
 *
 *              In this C version, the following C library functions are used:
 *              - strcpy, strcmp (inside the measurement loop)
 *              - printf, scanf (outside the measurement loop)
 *              In addition, UNIX system calls "times ()" or "time ()"
 *              are used for execution time measurement. For measurements
 *              on other systems, these calls have to be changed.
 *
 *  Collection of Results:
 *              Reinhold Weicker (address see above) and
 *
 *              Rick Richardson
 *              PC Research. Inc.
 *              94 Apple Orchard Drive
 *              Tinton Falls, NJ 07724
 *                      Phone:  (201) 834-1378 (9-17 EST)
 *                      Usenet: ...!seismo!uunet!pcrat!rick
 *
 *      Please send results to Reinhold Weicker and/or Rick Richardson.
 *      Complete information should be given on hardware and software used.
 *      Hardware information includes: Machine type, CPU, type and size
 *      of caches; for microprocessors: clock frequency, memory speed
 *      (number of wait states).
 *      Software information includes: Compiler (and runtime library)
 *      manufacturer and version, compilation switches, OS version.
 *      The Operating System version may give an indication about the
```

```
 *      compiler; Dhrystone itself performs no OS calls in the measurement loop.
 *
 *      The complete output generated by the program should be mailed
 *      such that at least some checks for correctness can be made.
 */
/*
 ****************************************************************************
 *
 *  History:    This version C/2.0 has been made for two reasons:
 *
 *              1) There is an obvious need for a common C version of
 *              Dhrystone, since C is at present the most popular system
 *              programming language for the class of processors
 *              (microcomputers, minicomputers) where Dhrystone is used most.
 *              There should be, as far as possible, only one C version of
 *              Dhrystone such that results can be compared without
 *              restrictions. In the past, the C versions distributed
 *              by Rick Richardson (Version 1.1) and by Reinhold Weicker
 *              had small (though not significant) differences.
 *
 *              2) As far as it is possible without changes to the Dhrystone
 *              statistics, optimizing compilers should be prevented from
 *              removing significant statements.
 *
 *              This C version has been developed in cooperation with
 *              Rick Richardson (Tinton Falls, NJ), it incorporates many
 *              ideas from the "Version 1.1" distributed previously by
 *              him over the UNIX network Usenet.
 *              I also thank Chaim Benedelac (National Semiconductor),
 *              David Ditzel (SUN), Earl Killian and John Mashey (MIPS),
 *              Alan Smith and Rafael Saavedra-Barrera (UC at Berkeley)
 *              for their help with comments on earlier versions of the
 *              benchmark.
 *
 *  Changes:    In the initialization part, this version follows mostly
 *              Rick Richardson's version distributed via Usenet, not the
 *              version distributed earlier via floppy disk by Reinhold Weicker.
 *              As a concession to older compilers, names have been made
 *              unique within the first 8 characters.
 *              Inside the measurement loop, this version follows the
 *              version previously distributed by Reinhold Weicker.
 *
 *              At several places in the benchmark, code has been added,
 *              but within the measurement loop only in branches that
 *              are not executed. The intention is that optimizing compilers
 *              should be prevented from moving code out of the measurement
 *              loop, or from removing code altogether. Since the statements
 *              that are executed within the measurement loop have NOT been
 *              changed, the numbers defining the "Dhrystone distribution"
 *              (distribution of statements, operand types and locality)
 *              still hold. Except for sophisticated optimizing compilers,
 *              execution times for this version should be the same as
 *              for previous versions.
```

```
 *
 *              Since it has proven difficult to subtract the time for the
 *              measurement loop overhead in a correct way, the loop check
 *              has been made a part of the benchmark. This does have
 *              an impact - though a very minor one - on the distribution
 *              statistics which have been updated for this version.
 *
 *              All changes within the measurement loop are described
 *              and discussed in the companion paper "Rationale for
 *              Dhrystone version 2".
 *
 *              Because of the self-imposed limitation that the order and
 *              distribution of the executed statements should not be
 *              changed, there are still cases where optimizing compilers
 *              may not generate code for some statements. To a certain
 *              degree, this is unavoidable for small synthetic benchmarks.
 *              Users of the benchmark are advised to check code listings
 *              whether code is generated for all statements of Dhrystone.
 */
/*
 ************************************************************************
 *
 * Defines:     The following "Defines" are possible:
 *              -DREG=register          (default: Not defined)
 *                      As an approximation to what an average C programmer
 *                      might do, the "register" storage class is applied
 *                      (if enabled by -DREG=register)
 *                      - for local variables, if they are used (dynamically)
 *                        five or more times
 *                      - for parameters if they are used (dynamically)
 *                        six or more times
 *                      Note that an optimal "register" strategy is
 *                      compiler-dependent, and that "register" declarations
 *                      do not necessarily lead to faster execution.
 *              -DNOSTRUCTASSIGN        (default: Not defined)
 *                      Define if the C compiler does not support
 *                      assignment of structures.
 *              -DNOENUMS               (default: Not defined)
 *                      Define if the C compiler does not support
 *                      enumeration types.
 *              -DTIMES                 (default)
 *              -DTIME
 *                      The "times" function of UNIX (returning process times)
 *                      or the "time" function (returning wallclock time)
 *                      is used for measurement.
 *                      For single user machines, "time ()" is adequate. For
 *                      multi-user machines where you cannot get single-user
 *                      access, use the "times ()" function. If you have
 *                      neither, use a stopwatch in the dead of night.
 *                      "printf"s are provided marking the points "Start Timer"
 *                      and "Stop Timer". DO NOT use the UNIX "time(1)"
 *                      command, as this will measure the total time to
 *                      run this program, which will (erroneously) include
```

```
 *                      the time to allocate storage (malloc) and to perform
 *                      the initialization.
 *              -DHZ=nnn                (default: 60)
 *                      The function "times" returns process times in
 *                      1/HZ seconds, with HZ = 60 for most systems.
 *                      CHECK YOUR SYSTEM DESCRIPTION BEFORE YOU JUST APPLY
 *                      THE DEFAULT VALUE.
 */
/*
 ************************************************************************
 *
 *  Compilation model and measurement (IMPORTANT):
 *
 *  This C version of Dhrystone consists of three files:
 *  - dhry_global.h (this file, containing global definitions and comments)
 *  - dhry_pack_1.c (containing the code corresponding to Ada package Pack_1)
 *  - dhry_pack_2.c (containing the code corresponding to Ada package Pack_2)
 *
 *  The following "ground rules" apply for measurements:
 *  - Separate compilation
 *  - No procedure merging
 *  - Otherwise, compiler optimizations are allowed but should be indicated
 *  - Default results are those without register declarations
 *  See the companion paper "Rationale for Dhrystone Version 2" for a more
 *  detailed discussion of these ground rules.
 *
 *  For 16-Bit processors (e.g. 80186, 80286), times for all compilation
 *  models ("small", "medium", "large" etc.) should be given if possible,
 *  together with a definition of these models for the compiler system used.
 */
/*
 ************************************************************************
 *
 *  Dhrystone (C version) statistics:
 *
 *  [Comment from the first distribution, updated for version 2.
 *   Note that because of language differences, the numbers are slightly
 *   different from the Ada version.]
 *
 *  The following program contains statements of a high level programming
 *  language (here: C) in a distribution considered representative:
 *
 *    assignments                   52 (51.0 %)
 *    control statements            33 (32.4 %)
 *    procedure, function calls     17 (16.7 %)
 *
 *  103 statements are dynamically executed. The program is balanced with
 *  respect to the three aspects:
 *
 *    - statement type
 *    - operand type
 *    - operand locality
 *         operand global, local, parameter, or constant.
```

```
*
*  The combination of these three aspects is balanced only approximately.
*
*  1. Statement Type:
*  -----------------              number
*
*     V1 = V2                      9
*       (incl. V1 = F(..)
*     V = Constant                12
*     Assignment,                  7
*       with array element
*     Assignment,                  6
*       with record component
*                                 --
*                                 34       34
*
*     X = Y +|-|"&&"|"|" Z         5
*     X = Y +|-|"==" Constant      6
*     X = X +|- 1                  3
*     X = Y *|/ Z                  2
*     X = Expression,              1
*           two operators
*     X = Expression,              1
*           three operators
*                                 --
*                                 18       18
*
*     if ....                     14
*       with "else"      7
*       without "else"   7
*           executed        3
*           not executed    4
*     for ...                      7  |  counted every time
*     while ...                    4  |  the loop condition
*     do ... while                 1  |  is evaluated
*     switch ...                   1
*     break                        1
*     declaration with             1
*       initialization
*                                 --
*                                 34       34
*
*     P (...)  procedure call     11
*       user procedure      10
*       library procedure    1
*     X = F (...)
*             function  call       6
*       user function         5
*       library function      1
*                                 --
*                                 17       17
*                                         ---
*                                        103
```

```
*
*    The average number of parameters in procedure or function calls
*    is 1.82 (not counting the function values as implicit parameters).
*
*
*  2. Operators
*  ------------
*                           number    approximate
*                                     percentage
*
*    Arithmetic              32          50.8
*
*       +                      21          33.3
*       -                       7          11.1
*       *                       3           4.8
*       / (int div)             1           1.6
*
*    Comparison              27           42.8
*
*       ==                      9           14.3
*       /=                      4           6.3
*       >                       1           1.6
*       <                       3           4.8
*       >=                      1           1.6
*       <=                      9           14.3
*
*    Logic                    4            6.3
*
*       && (AND-THEN)           1           1.6
*       |  (OR)                1           1.6
*       !  (NOT)               2           3.2
*
*                           --          -----
*                           63          100.1
*
*
*  3. Operand Type (counted once per operand reference):
*  ---------------
*                           number    approximate
*                                     percentage
*
*     Integer               175        72.3 %
*     Character              45        18.6 %
*     Pointer                12         5.0 %
*     String30                6         2.5 %
*     Array                   2         0.8 %
*     Record                  2         0.8 %
*                           ---       -------
*                           242       100.0 %
*
*  When there is an access path leading to the final operand (e.g. a record
*  component), only the final data type on the access path is counted.
*
```

```
 *
 *  4. Operand Locality:
 *  --------------------
 *                                 number    approximate
 *                                           percentage
 *
 *     local variable               114        47.1 %
 *     global variable               22         9.1 %
 *     parameter                     45        18.6 %
 *     value                         23         9.5 %
 *     reference                     22         9.1 %
 *     function result                6         2.5 %
 *     constant                      55        22.7 %
 *                                  ---       -------
 *                                  242       100.0 %
 *
 *
 *  The program does not compute anything meaningful, but it is syntactically
 *  and semantically correct. All variables have a value assigned to them
 *  before they are used as a source operand.
 *
 *  There has been no explicit effort to account for the effects of a
 *  cache, or to balance the use of long or short displacements for code or
 *  data.
 *

    dhry.ttp 30000

Dhrystone Benchmark, Version 2.0 (Language: C)

System:   Atari MegsST 4 (TOS, 8 Mhz)
Compiler: DRI/Alcyon 4.14

Program compiled with 'register' attribute

Execution starts, 30000 runs through Dhrystone
Execution ends

Final values of the variables used in the benchmark:

Int_Glob:            5
        should be:   5
Bool_Glob:           1
        should be:   1
Ch_1_Glob:           A
```

```
        should be:   A
Ch_2_Glob:           B
        should be:   B
Ar_1_Glob[8]:        7
        should be:   7
Ar_2_Glob[8][7]:     30010
        should be:   Number_Of_Runs + 10
Ptr_Glob->
  Ptr_Comp:          22250
        should be:   (implementation-dependent)
  Discr:             0
        should be:   0
  Enum_Comp:         2
        should be:   2
  Int_Comp:          17
        should be:   17
  Str_Comp:          DHRYSTONE PROGRAM, SOME STRING
        should be:   DHRYSTONE PROGRAM, SOME STRING
Next_Ptr_Glob->
  Ptr_Comp:          22250
        should be:   (implementation-dependent), same as above
  Discr:             0
        should be:   0
  Enum_Comp:         1
        should be:   1
  Int_Comp:          18
        should be:   18
  Str_Comp:          DHRYSTONE PROGRAM, SOME STRING
        should be:   DHRYSTONE PROGRAM, SOME STRING
Int_1_Loc:           5
        should be:   5
Int_2_Loc:           13
        should be:   13
Int_3_Loc:           7
        should be:   7
Enum_Loc:            1
        should be:   1
Str_1_Loc:           DHRYSTONE PROGRAM, 1'ST STRING
        should be:   DHRYSTONE PROGRAM, 1'ST STRING
Str_2_Loc:           DHRYSTONE PROGRAM, 2'ND STRING
        should be:   DHRYSTONE PROGRAM, 2'ND STRING

Microseconds for one run through Dhrystone: 1449.9
Dhrystones per Second:                       719.2

The votes are in on changing from shar to uue-{zoo,arc} format, and the
uues have it.

I'll try to regularly (once per volume) post pointers to source code for
the various archiving and decoding programs, and make sure that they're
available on the panarthea archive.

Some notable comments:

>From: tim@brspyr1.brs.com (Tim Northrup)
>
>Both ZOO and ARC are now commonly available on Unix systems (much more so
>than when comp.sources.atari.st was started), so why bother with a shar
>file?

>From: Ron Abramson <rona@hpdml93.hp.com>
>
>It seems to me that if uuencoded arc files are good enough for
>comp.binaries.atari.st, then they ought to be good enough for
>comp.sources.atari.st
>
>I don't understand why a person (be it a he or she :~}) should need
>to learn a new technique to retrieve source files.

>From: sluka@stoch.fmi.uni-passau.de (Bernd Sluka)
>
>I always un-shar your sources and repack them as arc- or zoo-archives
>on my sun before transfering them to the st via an PC-clone.
>So in my point of view it would be better to use uue'd arc- or zoo-files
>for the sources, too.

And one of the few dissenting votes,

>From: saj@chinet.chi.il.us (Stephen Jacobs)
>
>I like to keep sources in readable form. What you might do is dictate a
>particular shar format, and provide tools to create and disassemble those
>files in the monthly posting.

Posting-number: Volume 3, Issue 13
Archive-name: dhrystone

this is a port of the dhrystone bm, v2.0, i found on the MIPS BBS. when
run on my mega4, compiled with alcyon 4.14, it ran at about 719. see
the file OUT.ST for the results of that run.

 *
 *                   "DHRYSTONE" Benchmark Program
 *                   -----------------------------
 *
 *  Version:    C, Version 2.0
 *
 *  Date:       March 3, 1988
 *
 *  Author:     Reinhold P. Weicker
 *                      Siemens AG, E STE 35
 *                      Postfach 3240
 *                      8520 Erlangen
 *                      Germany (West)
 *                              Phone:  [xxx-49]-9131-7-20330
 *                                      (8-17 Central European Time)
 *                              Usenet: ..!mcvax!unido!estevax!weicker
 *
 *              Original Version (in Ada) published in
 *              "Communications of the ACM" vol. 27., no. 10 (Oct. 1984),
 *              pp. 1013 - 1030, together with the statistics
 *              on which the distribution of statements etc. is based.
 *
 *              In this C version, the following C library functions are used:
 *              - strcpy, strcmp (inside the measurement loop)
 *              - printf, scanf (outside the measurement loop)
 *              In addition, UNIX system calls "times ()" or "time ()"
 *              are used for execution time measurement. For measurements
 *              on other systems, these calls have to be changed.
 *
 *  Collection of Results:
 *              Reinhold Weicker (address see above) and
 *
 *              Rick Richardson
 *              PC Research. Inc.
 *              94 Apple Orchard Drive
 *              Tinton Falls, NJ 07724
 *                      Phone:  (201) 834-1378 (9-17 EST)
 *                      Usenet: ...!seismo!uunet!pcrat!rick
 *
 *      Please send results to Reinhold Weicker and/or Rick Richardson.
```

```
 *      Complete information should be given on hardware and software used.
 *      Hardware information includes: Machine type, CPU, type and size
 *      of caches; for microprocessors: clock frequency, memory speed
 *      (number of wait states).
 *      Software information includes: Compiler (and runtime library)
 *      manufacturer and version, compilation switches, OS version.
 *      The Operating System version may give an indication about the
 *      compiler; Dhrystone itself performs no OS calls in the measurement loop.
 *
 *      The complete output generated by the program should be mailed
 *      such that at least some checks for correctness can be made.
 */
/*
 ************************************************************************
 *
 *  History:    This version C/2.0 has been made for two reasons:
 *
 *              1) There is an obvious need for a common C version of
 *              Dhrystone, since C is at present the most popular system
 *              programming language for the class of processors
 *              (microcomputers, minicomputers) where Dhrystone is used most.
 *              There should be, as far as possible, only one C version of
 *              Dhrystone such that results can be compared without
 *              restrictions. In the past, the C versions distributed
 *              by Rick Richardson (Version 1.1) and by Reinhold Weicker
 *              had small (though not significant) differences.
 *
 *              2) As far as it is possible without changes to the Dhrystone
 *              statistics, optimizing compilers should be prevented from
 *              removing significant statements.
 *
 *              This C version has been developed in cooperation with
 *              Rick Richardson (Tinton Falls, NJ), it incorporates many
 *              ideas from the "Version 1.1" distributed previously by
 *              him over the UNIX network Usenet.
 *              I also thank Chaim Benedelac (National Semiconductor),
 *              David Ditzel (SUN), Earl Killian and John Mashey (MIPS),
 *              Alan Smith and Rafael Saavedra-Barrera (UC at Berkeley)
 *              for their help with comments on earlier versions of the
 *              benchmark.
 *
 *  Changes:    In the initialization part, this version follows mostly
 *              Rick Richardson's version distributed via Usenet, not the
 *              version distributed earlier via floppy disk by Reinhold Weicker.
 *              As a concession to older compilers, names have been made
 *              unique within the first 8 characters.
 *              Inside the measurement loop, this version follows the
 *              version previously distributed by Reinhold Weicker.
 *
 *              At several places in the benchmark, code has been added,
 *              but within the measurement loop only in branches that
 *              are not executed. The intention is that optimizing compilers
 *              should be prevented from moving code out of the measurement
```

```
 *              loop, or from removing code altogether. Since the statements
 *              that are executed within the measurement loop have NOT been
 *              changed, the numbers defining the "Dhrystone distribution"
 *              (distribution of statements, operand types and locality)
 *              still hold. Except for sophisticated optimizing compilers,
 *              execution times for this version should be the same as
 *              for previous versions.
 *
 *              Since it has proven difficult to subtract the time for the
 *              measurement loop overhead in a correct way, the loop check
 *              has been made a part of the benchmark. This does have
 *              an impact - though a very minor one - on the distribution
 *              statistics which have been updated for this version.
 *
 *              All changes within the measurement loop are described
 *              and discussed in the companion paper "Rationale for
 *              Dhrystone version 2".
 *
 *              Because of the self-imposed limitation that the order and
 *              distribution of the executed statements should not be
 *              changed, there are still cases where optimizing compilers
 *              may not generate code for some statements. To a certain
 *              degree, this is unavoidable for small synthetic benchmarks.
 *              Users of the benchmark are advised to check code listings
 *              whether code is generated for all statements of Dhrystone.
 */
/*
 ************************************************************************
 *
 * Defines:     The following "Defines" are possible:
 *              -DREG=register          (default: Not defined)
 *                      As an approximation to what an average C programmer
 *                      might do, the "register" storage class is applied
 *                      (if enabled by -DREG=register)
 *                      - for local variables, if they are used (dynamically)
 *                        five or more times
 *                      - for parameters if they are used (dynamically)
 *                        six or more times
 *                      Note that an optimal "register" strategy is
 *                      compiler-dependent, and that "register" declarations
 *                      do not necessarily lead to faster execution.
 *              -DNOSTRUCTASSIGN        (default: Not defined)
 *                      Define if the C compiler does not support
 *                      assignment of structures.
 *              -DNOENUMS               (default: Not defined)
 *                      Define if the C compiler does not support
 *                      enumeration types.
 *              -DTIMES                 (default)
 *              -DTIME
 *                      The "times" function of UNIX (returning process times)
 *                      or the "time" function (returning wallclock time)
 *                      is used for measurement.
 *                      For single user machines, "time ()" is adequate. For
```

```
 *                      multi-user machines where you cannot get single-user
 *                      access, use the "times ()" function. If you have
 *                      neither, use a stopwatch in the dead of night.
 *                      "printf"s are provided marking the points "Start Timer"
 *                      and "Stop Timer". DO NOT use the UNIX "time(1)"
 *                      command, as this will measure the total time to
 *                      run this program, which will (erroneously) include
 *                      the time to allocate storage (malloc) and to perform
 *                      the initialization.
 *              -DHZ=nnn                (default: 60)
 *                      The function "times" returns process times in
 *                      1/HZ seconds, with HZ = 60 for most systems.
 *                      CHECK YOUR SYSTEM DESCRIPTION BEFORE YOU JUST APPLY
 *                      THE DEFAULT VALUE.
 */
/*
 *************************************************************************
 *
 *  Compilation model and measurement (IMPORTANT):
 *
 *  This C version of Dhrystone consists of three files:
 *  - dhry_global.h (this file, containing global definitions and comments)
 *  - dhry_pack_1.c (containing the code corresponding to Ada package Pack_1)
 *  - dhry_pack_2.c (containing the code corresponding to Ada package Pack_2)
 *
 *  The following "ground rules" apply for measurements:
 *  - Separate compilation
 *  - No procedure merging
 *  - Otherwise, compiler optimizations are allowed but should be indicated
 *  - Default results are those without register declarations
 *  See the companion paper "Rationale for Dhrystone Version 2" for a more
 *  detailed discussion of these ground rules.
 *
 *  For 16-Bit processors (e.g. 80186, 80286), times for all compilation
 *  models ("small", "medium", "large" etc.) should be given if possible,
 *  together with a definition of these models for the compiler system used.
 */
/*
 *************************************************************************
 *
 *  Dhrystone (C version) statistics:
 *
 *  [Comment from the first distribution, updated for version 2.
 *   Note that because of language differences, the numbers are slightly
 *   different from the Ada version.]
 *
 *  The following program contains statements of a high level programming
 *  language (here: C) in a distribution considered representative:
 *
 *    assignments                   52 (51.0 %)
 *    control statements            33 (32.4 %)
 *    procedure, function calls     17 (16.7 %)
 *
```

```
*  103 statements are dynamically executed. The program is balanced with
*  respect to the three aspects:
*
*    - statement type
*    - operand type
*    - operand locality
*         operand global, local, parameter, or constant.
*
*  The combination of these three aspects is balanced only approximately.
*
*  1. Statement Type:
*  -----------------              number
*
*     V1 = V2                      9
*       (incl. V1 = F(..)
*     V = Constant                12
*     Assignment,                  7
*       with array element
*     Assignment,                  6
*       with record component
*                                 --
*                                 34       34
*
*     X = Y +|-|"&&"|"|" Z         5
*     X = Y +|-|"==" Constant      6
*     X = X +|- 1                  3
*     X = Y *|/ Z                  2
*     X = Expression,              1
*           two operators
*     X = Expression,              1
*           three operators
*                                 --
*                                 18       18
*
*     if ....                     14
*       with "else"      7
*       without "else"   7
*           executed        3
*           not executed    4
*     for ...                      7  |  counted every time
*     while ...                    4  |  the loop condition
*     do ... while                 1  |  is evaluated
*     switch ...                   1
*     break                        1
*     declaration with             1
*       initialization
*                                 --
*                                 34       34
*
*     P (...)  procedure call     11
*       user procedure      10
*       library procedure    1
*     X = F (...)
```

```
*             function  call      6
*       user function        5
*       library function     1
*                              --
*                              17       17
*                                      ---
*                                      103
*
*    The average number of parameters in procedure or function calls
*    is 1.82 (not counting the function values as implicit parameters).
*
*
*  2. Operators
*  ------------
*                           number    approximate
*                                     percentage
*
*    Arithmetic              32          50.8
*
*       +                      21          33.3
*       -                       7          11.1
*       *                       3           4.8
*       / (int div)             1           1.6
*
*    Comparison              27           42.8
*
*       ==                      9           14.3
*       /=                      4           6.3
*       >                       1           1.6
*       <                       3           4.8
*       >=                      1           1.6
*       <=                      9           14.3
*
*    Logic                    4            6.3
*
*       && (AND-THEN)           1           1.6
*       |  (OR)                1           1.6
*       !  (NOT)               2           3.2
*
*                            --          -----
*                            63          100.1
*
*
*  3. Operand Type (counted once per operand reference):
*  ---------------
*                           number    approximate
*                                     percentage
*
*     Integer               175        72.3 %
*     Character              45        18.6 %
*     Pointer                12         5.0 %
*     String30                6         2.5 %
*     Array                   2         0.8 %
```

```
 *     Record                    2         0.8 %
 *                             ---       -------
 *                             242       100.0 %
 *
 *  When there is an access path leading to the final operand (e.g. a record
 *  component), only the final data type on the access path is counted.
 *
 *
 *  4. Operand Locality:
 *  -------------------
 *                                 number    approximate
 *                                           percentage
 *
 *     local variable               114        47.1 %
 *     global variable               22         9.1 %
 *     parameter                     45        18.6 %
 *     value                         23         9.5 %
 *     reference                     22         9.1 %
 *     function result                6         2.5 %
 *     constant                      55        22.7 %
 *                                  ---       -------
 *                                  242       100.0 %
 *
 *
 *  The program does not compute anything meaningful, but it is syntactically
 *  and semantically correct. All variables have a value assigned to them
 *  before they are used as a source operand.
 *
 *  There has been no explicit effort to account for the effects of a
 *  cache, or to balance the use of long or short displacements for code or
 *  data.
 *

Dhrystone Benchmark, Version 2.0 (Language: C)

System:   Atari MegsST 4 (TOS, 8 Mhz)
Compiler: DRI/Alcyon 4.14

Program compiled with 'register' attribute

Execution starts, 30000 runs through Dhrystone
Execution ends
```

```
Final values of the variables used in the benchmark:

Int_Glob:            5
        should be:   5
Bool_Glob:           1
        should be:   1
Ch_1_Glob:           A
        should be:   A

Submitted-by: csrobe@cs.wm.edu (Chip Roberson)
Posting-number: Volume 3, Issue 25
Archive-name: barcodes

I noticed that someone was asking about barcodes recently and in
my metafont searches for [La]Tex, I discovered the barcodes.mf. I
know nothing more that what it says in the header and I have not
tried it. If you decide to use this you will need TeX (or LaTeX)
and metafont (available from archive-server@panarthea.ebay.sun.com).

barcodes.mf can be anonymously ftp'd from sun.soe.clarkson.edu's
pub/tex-fonts directory.

cheers,
-chip

% From: Dimitri Vulis <CLDLV%NASAGISS.BITNET@forsythe.stanford.edu>
% Subject: Foo (bar codes)
%
% Dear Malcolm: I believe that the following file would of general
% interest, but I think it's too long for the digest:
%
% I was amazed to find out that business people pay enormous money for the
% ability to produce bar codes. This ought to be TRIVIAL with \TeX.
% So, I got hold of a public domain BASIC program that supposedly does that and
% lifted the codes and put them into METAFONT (it was EASY). Caveat(s): I have
% never tested these codes with an OCR. The BASIC program said it used `3 of 9'
% encoding. I presume it's not the same as UPC. The sizes may be off---I
% took them from the BASIC program that used HP LJ's 100dpi graphics mode.
% Disclaimer: I haven't tested these codes. Use them at your own risk.
% Remarks:

```
% 1) White space is a displayable character.
% 2) There are 9 significant strips, bwbwbwbwb; 3 of them are wide.
% 3) The white_naro; at the end of each code is the inter-code spacing.
% Credits: the original BASIC program was written by `Bill Wood Mil., WI' and
% later re-written by `Bill Baines, Enfield, CT.'. METAFONT version is by
% `Dimitri Vulis CLDLV@NASAGISS.BITNET'

Posting-number: Volume 3, Issue 57
Archive-name: gfa-uucode

 Here is a UUE encoder and decoder. This is for mainly the people
who don't have a UUE untility. Simply capture this file in your
buffer and later load it into GFA basic and edit out the non-program
and run. This will create a UUCODE.ACC which is a UUE accesory that
will allow you access to the UUE world. I cant take credit for this
accesory, Moches Branner made about two years ago, and no one has yet
inproved on it's speed.

Stuart Carter

Physics Dept.

```
'---------------------------CUT HERE---------------------------------
'                Stuart Carter's   Hex-decoder                      '
'              Version 1.0               4/10/90                    '
' ----------------------------------------------------------------- '
' This program is a simple Hex decoder that contains Moshse Branner's
' (Sorry if i misspelled it) UUCODE acessory. This program will help
' you get started with using file transfers that require ASCII codeings.
' Useing UUCODE.ACC is simple and straight forward except for that:
' 1) Check to make sure UUE file has been re-assembled into one smooth
'    flow of data. (I use Tempus to put files back together.)
' 2) Some UUE files dont have a little "u" or such to end a line. This
'    causes loss of data if end character is a space. Manualy insert
'    spaces if you have a file like this. (Better yet, write a program
'    to do it for you.)
'
'                                                 Have Fun, Stuart

10    'This program, written in ST Basic, draws the "Sierpinski
20    'Triangle" in randomly-selected sizes and shapes. It illustrates
30    'some principles of chaos theory, such as fractals and self-
40    'similarity, bounded randomness, and constant complexity
50    'across orders of scale. A discussion of the "affine transfor-
60    'mations" used to create this diagram was presented on the PBS
70    'program "Nova" in January 1989, and also in the May 1990 issue
80    'of SCIENTIFIC AMERICAN. Have fun with this one--
90    '        Michael Johnston  (WJOHNSTON@COLGATEU.BITNET)

Archive-name: bifurc

```
100   'This program, written in ST Basic, uses a "difference equation"
110   '(line 330) to model the effects of driving a dynamic system at
120   'increasingly high rates. The result is a bifurcation diagram
130   'which represents the growth rates of biological populations
140   '(on the Y axis) at increasingly high rates of fertility (X axis). At
150   'low to moderate fertility rates, rates of increase
160   'reach an equilibrium. But at higher rates, a boom-and-bust
170   'cycle is revealed in the form of "period doubling"; and further
180   'to the right, the results are chaotic. For a more detailed
190   'discussion, see James Gleick, CHAOS: MAKING A NEW SCIENCE
200   '(Viking 1987), pp. 59-80. Be forewarned: this program takes
210   ' a LOOOONNNNNGGGGGGG time to run ( ~ 40 minutes), but the
220   'results are interesting. Note also that by playing with the
230   'values of R and X (line 310), and the integer values in
240   'the second statements of lines 390 and 510, you can
250   '"zoom in" on various segments of this diagram.
260   'Have fun--
270   '          Michael Johnston  (WJOHNSTON@COLGATEU.BITNET)

Archive-name: sozo1.2pat

Here is a bug fix for "top" in Sozobon release 1.2.  You will need it if
you use the -O option at all.

Basically, several calls to the function "uses" or "sets" were incorrectly
coded with register masks instead of register numbers.  The fix is to
take out the RM() calls in several places.

Also, line 299 of peep3.c should call "uses" instead of "sets" with the
first parameter being "i2" not "i3".

In "peep2.c", make the following changes:

688c688
<             if (uses(i2, RM(dr1)))
---
>             if (uses(i2, dr1))
736c736
<             if (uses(i2, RM(dr1)))
---
>             if (uses(i2, dr1))
784c784
<             if (uses(i2, RM(dr1)))
---
```

```
>             if (uses(i2, dr1))
```

In "peep3.c", make the following changes:

```
299c299
<        !sets(i3, RM(i3->src.areg))) {
---
>        !uses(i2, i3->src.areg)) {
333c333
<                 if (sets(i3, RM(rm)))
---
>                 if (sets(i3, rm))
400c400
<                 if (sets(i3, RM(rm)))
---
>                 if (sets(i3, rm))
467c467
<                 if (sets(i3, RM(rm)))
---
>                 if (sets(i3, rm))
```

After you have made these changes, recompile the optimizer "top" without the
-O option (dont use the old "top"). Then install this fixed version of "top".
Now recompile again with the -O option (e.g. using the newly make "top").
Now install this "top" as your new version.

Submitted-by: rosenkra%c1yankee@convex.com (Bill Rosenkranz)
Posting-number: Volume 3, Issue 90

Archive-name: nroff110pat

This is patch 1 for nroff v1.10 for atari/TOS (diff -c files below, no shar, they are small).

Note: there is a GNU version of troff (groff). Most likely it will not fit under minix, but it should work under TOS. It will probably need gcc to compile, however. I have not tried this. It comes with tbl, eqn, and pic, I believe.

Note: if you wish to compile nroff under TOS, you will need ctype (isalpha, isspace, islower, isdigit, isprint), stdio (of course), strings (strncmp, strcmp, strlen, strcpy, strcat, atoi, tolower), abs (macro normally), and unix compatible versions of getenv(3), time(3), and ctime(3). Most compilers support these, or you could get the PD/sharewhare (???) dLibs package which is very good. For unix, you will also need tgetstr(3) from termcap (or terminfo). I use Alcyon 4.14 with my own libc.a. There is also a single call to GEMDOS Cconin (to support the -h option).

Note: if you feel up to making changes to this nroff, pls mail the changes to me in "diff -c" format so I can try and keep this version up to date.

This patch adds the "-raN" switch to the command line to preset a (single char) number register (a) to decimal integer value N. In this version of nroff, there are only single char (user) number registers and case is ignored (thus there are 26 number registers besides the preset ones).

To test, the following file (I called it "nr.nr"):

```
% cat nr.nr
.\" file: nr.nr
.\" test "nroff -raN ..." (set number register)
.pl 20
register a = \na
.br
register b = \nb
.br
register c = \nc
.br
register d = \nd
.br
register e = \ne
.br
register f = \nf
.br
register g = \ng
.br
register h = \nh
.br
register i = \ni
.br
register j = \nj
.br
```

when used as follows:

```
% nroff -rc10 -rg20 nr.nr >xxx
```

produces the following output (file xxx):

```
% cat xxx

register a = 0
register b = 0
register c = 10
register d = 0
register e = 0
register f = 0
register g = 20
register h = 0
register i = 0
register j = 0
```

Here are the diffs for this simple fix to add this new feature. Fixes source file main.c (function "pswitch") and manpage nroff.man. There are only a couple of lines to add, so I did not think I needed a shar file for this:

Posting-number: Volume 3, Issue 95
Archive-name: nroff110pat2

This is patch 2 for nroff v1.10 for atari TOS.

It adds the .mc command (margin characters, useful for change bars).
It also adds some additional special character escapes (e.g. \(br, \(pl, etc)
and cleans up a few things. The manpage is changed to reflect the .mc
capability.

The patch is supplied as diff -c files (*.dif). This is a shar file. the
diffs were done on an ST and the file names have "\" in the path, if that
matters to your patch program...  [I didn't uuencode this, on the assumption
that if you can use "patch" you can probably unshar as well. -sg]

NOTE: Apply this patch after patch 1.
```

Enjoy...

-bill rosenkranz
rosenkra%c1yankee@convex.com

Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 4, Info 1
Archive-name: intro

This is the first of two introductory articles about comp.sources.atari.st.
This one describes how to submit source to the newsgroup, where the
archive sites are, and how to contact them.  The companion article lists
all previously-published sources.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
   koreth@panarthea.ebay.sun.com

--------------------

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to
atari-sources@panarthea.ebay.sun.com. If you are on a UUCP-only site, you
can send them to sun!ebay!panarthea!atari-sources.  In Europe, send your
submissions to Jan-Hinrich Fessel, the European submoderator of the group,
at unido!atari-sources (or, if you're a masochist, atari-sources@unido.
informatik.uni-dortmund.de.)

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small.  I try to verify that a
```

program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, source without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a pain to separate them, and such submissions are invariably placed on the back burner. Sources should be submitted in the same format as binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas' "uue" program if possible, as it can correct some common transmission errors. Split long submissions up into reasonable (less than 50K) chunks. "uue" will do this for you, if you use "uue -700 file" to encode.

Please inform me of any special system requirements, and what development environment was used, so that I can properly test your submission and label it when I post it.

Subject: The structure of comp.sources.atari.st articles

Each posting in comp.sources.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.sources.atari.st: sources and "information postings." They can be distinguished by the subject line:

  Subject: v04INF2: Index for Volume 1 and other info

This first word in the title identifies this as the third info posting of volume one. Similarly, the subject line shown below:

  Subject: v04i081: godsrc -- Universe simulator

identifies this as the 81st source article in Volume 4. Large sources are broken up into smaller pieces, and have subject lines that look like this:

  Subject: v04i088: decbustr -- VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

  Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

  Alcyon - Alcyon C (included with Atari developer's kit)
  MWC   - Mark Williams C

```
  Megamax - Megamax C
  Laser       - Laser C
  Lattice - Lattice C
  C       - Any C compiler
  OSI         - OSI Personal Pascal
  BASIC       - ST BASIC (this is not a joke!)
  uuencode    - program is uuencoded (uudecode required to unpack)
  arc         - program is archived (arc required to unpack)
  high        - high resolution
  medium  - medium resolution
  low         - low resolution
  1meg        - needs 1 meg of RAM
```

The first few lines of an article are auxiliary headers that look like this:

```
  Submitted-by: david@bdt.UUCP (David Beckmeyer)
  Posting-number: Volume 4, Issue 80
  Archive-name: micro-rtx
```

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

Please try to use this name when requesting that sources be mailed to you. Also, note that the "part number" given in the title, and the archive name given in the auxiliary header need not be identical.

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do try to limit filenames to eight characters whenever possible, though.

Subject: Reporting and tracking bugs and patches to postings

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain

the sources I moderate, so don't send your bug reports to me.

Subject: Listing of archive sites in no particular order

1. Site panarthea is running an archive server, which automatically answers mail requests. Send mail to archive-server@panarthea.ebay.sun.com with the word "help" in the message body for more information. Both the sources and binaries groups are archived on panarthea.
2. Unido is the European archive site. It's running an archive server similar to panarthea's; send "help" to unido!archive-server for more information. Unido archives both the sources and binaries groups.

If you know of additional sites which reliably archive comp.sources.atari.st (or comp.binaries.atari.st, for that matter), please tell me so I can add them to the list.

Comp.sources.atari.st and comp.binaries.atari.st postings of more than one
part now have References: lines, so that thread-following newsreaders such
as trn and nn can easily select all the parts of a particular program.

mgif 1.1

This is a new version of a GIF viewer for mono STs. It fixes a serious
bug and adds some new features. yes, it is slow, but u get src so u can
fix it. New for v1.1:

     - Change -i to -r (reverse black/white)

     - Change -q to -i (inqure)

     - Started to add -q (quantize), not complete

- Fix bug with zero'ed accumulation arrays (in dither routine) which was being done with every call to rasterize causing poor (i.e. incorrect) F-S dithering

- Add histogram for each rgb value (eliminate the "intensity order" histogram, too)

- Fix scan_CM (bug in goofy Alcyon/GEMLIB read)

- Make default -s of 40

- Histogram now impacted by -N (NTSC)

- Add -f option for filtering color "planes"

This is a GIF viewer for mono STs. It uses Floyd-Steinberg dithering to represent color images on bi-level devices (see Burger and Gillies, "Interactive Computer Graphics" for the reference I used).

There are 2 posts: binary and source.

It handles all image sizes, but clips to max of 640x400. It should handle up to 8-bit images (which is max GIF format, I believe).

It can rotate, mirror, invert, and expand images. It can also change the relative intensity of the image (in the dithering phase). There is an inquire option to just print info about the image (size, bits, etc). It will also plot a histogram, but does not do any image manipulation (such as histogram equalization or color quantization) beyond the transforms listed above. Use PBMplus for that.

Mgif can also dump the resulting image to a standard GEM .pi3 file.

enjoy...

Thanks to the several people who mentioned my ommission of a file
in the dvi2tty post. Here it is:

David

Submitted-by: koreth@panarthea.ebay.sun.com (Steven Grimm)
Posting-number: Volume 5, Info 1
Archive-name: intro

This is the first of two introductory articles about comp.sources.atari.st.
This one describes how to submit source to the newsgroup, where the
archive sites are, and how to contact them. The companion article lists
all previously-published sources.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
   koreth@panarthea.ebay.sun.com

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to
atari-sources@panarthea.ebay.sun.com. If you are on a UUCP-only site, you
can send them to sun!ebay!panarthea!atari-sources. In Europe, send your
submissions to Jan-Hinrich Fessel, the European submoderator of the group,
at unido!atari-sources (or, if you're a masochist, atari-sources@unido.
informatik.uni-dortmund.de.)

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a

program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, source without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a pain to separate them, and such submissions are invariably placed on the back burner. Sources should be submitted in the same format as binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas' "uue" program if possible, as it can correct some common transmission errors. Split long submissions up into reasonable (less than 50K) chunks. "uue" will do this for you, if you use "uue -700 file" to encode.

Please inform me of any special system requirements, and what development environment was used, so that I can properly test your submission and label it when I post it.

Subject: The structure of comp.sources.atari.st articles

Each posting in comp.sources.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.sources.atari.st: sources and "information postings." They can be distinguished by the subject line:

  Subject: v05INF2: Index for Volume 1 and other info

This first word in the title identifies this as the third info posting of volume one. Similarly, the subject line shown below:

  Subject: v05i081: godsrc -- Universe simulator

identifies this as the 81st source article in Volume 5. Large sources are broken up into smaller pieces, and have subject lines that look like this:

  Subject: v05i088: decbustr -- VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

  Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

  Alcyon - Alcyon C (included with Atari developer's kit)
  MWC   - Mark Williams C

```
  Megamax - Megamax C
  Laser       - Laser C
  Lattice - Lattice C
  C       - Any C compiler
  OSS         - OSS Personal Pascal
  BASIC       - ST BASIC (this is not a joke!)
  uuencode    - program is uuencoded (uudecode required to unpack)
  arc         - program is archived (arc required to unpack)
  high        - high resolution
  medium  - medium resolution
  low         - low resolution
  1meg        - needs 1 meg of RAM
```

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

```
  Submitted-by: david@bdt.UUCP (David Beckmeyer)
  Posting-number: Volume 5, Issue 80
  Archive-name: micro-rtx
```

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

Please try to use this name when requesting that sources be mailed to you. Also, note that the "part number" given in the title, and the archive name given in the auxiliary header need not be identical.

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do try to limit filenames to eight characters whenever possible, though.

Subject: Reporting and tracking bugs and patches to postings

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes

to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header.
Often there is a contact address in a README file, too. I do not maintain
the sources I moderate, so don't send your bug reports to me.

Subject: Listing of archive sites in no particular order

1. Site panarthea is running an archive server, which automatically answers
   mail requests. Send mail to archive-server@panarthea.ebay.sun.com with the
   word "help" in the message body for more information. Both the sources
   and binaries groups are archived on panarthea.
2. Unido is the European archive site. It's running an archive server
   similar to panarthea's; send "help" to unido!archive-server for more
   information. Unido archives both the sources and binaries groups.

If you know of additional sites which reliably archive comp.sources.atari.st
(or comp.binaries.atari.st, for that matter), please tell me so I can add
them to the list.

From: david@doe.utoronto.ca (David Megginson)
Subject: PATCH for tr(1v) to fix bug (please apply)
Message-ID: <1991Mar25.161423.24739@doe.utoronto.ca>
Followup-To: comp.sys.atari.st
Summary: tr prints out the last buffer twice!
Sender: david@doe.utoronto.ca (David Megginson)
Organization: Dictionary of Old English Project - U of Toronto
Date: Mon, 25 Mar 1991 16:14:23 GMT

I have found a bug in my tr(1v) clone for MiNT--under some circumstances,
the program will write out the last buffer twice. I am posting this patch
to comp.sys.atari.st and comp.sources.atari.st, and I will post the full
fixed sources and binaries in a week or so (they should take another week
to appear). Until then, could anyone using my tr or wc please send in any
other bugs, comments or requests, so that I can (maybe) incorporate them?

Thank you.

David

Apply this patch to tr.c:

comp.sys.atari.st:82888 news.groups:137936

I've moved locations at Sun, and my machine came with me. I've moved all my
moderation gear over to the new location, so comp.sources.atari.st and
comp.binaries.atari.st submissions should be sent here instead of to the old
addresses. The new addresses are:

atari-sources@twitterpater.eng.sun.com for comp.sources.atari.st submissions
atari-binaries@twitterpater.eng.sun.com for comp.binaries.atari.st submissions

The panarthea archive server has also been moved to twitterpater. Its
address, as you can probably guess, is now

archive-server@twitterpater.eng.sun.com

The panarthea addresses for all of the above will continue to work for a while,
but they'll forward everything to twitterpater. If you maintain a list of
archive sites, please note the change.

Please let me know if there are any problems. I've tested everything and think
I have things completely moved over, but I might have missed something.

Steven Grimm koreth@eng.sun.com   Moderator, comp.{sources,binaries}.atari.st

------------------------start of emacs.rc-----------------------------------
```
;#####################################################################################
;
; This emacs.rc file can be used by Atari ST owners who whan to use the
; facilities of micro emacs in C source code editing.
;
; I have written this file for my own use but it's so usefull I have decided
; to bring this to the public eyes. You can distribute this file since he
; remain unaltered, no charge can be assked and my name and e-mail adress
; musn't be deleted nor modified. I you wan to distribute a modified version
; give me the credit for the original version and send me a copy at the
; e-mail adress found bellow.
;
; A file named "ERROR" must be loaded, the screen will be splited in two
; windows. Just press M-E on an error or warning line preduced by TCC to load
; the aproriate file at the line of the error.
;
; Some work can be done on this macro:
;    -we can check if the cursor really on an error line
;    -the find-file command can fail but such errors are not handled.

Submitted-by: koreth@twitterpater.eng.sun.com (Steven Grimm)
Posting-number: Volume 6, Info 1
Archive-name: intro

This is the first of two introductory articles about comp.sources.atari.st.
This one describes how to submit source to the newsgroup, where the
archive sites are, and how to contact them.  The companion article lists
all previously-published sources.

I am always looking for suggestions on how to improve the usefulness
```

of the newsgroup, and can be contacted as listed below.

   koreth@twitterpater.eng.sun.com

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to atari-sources@twitterpater.eng.sun.com. If you are on a UUCP-only site, you can send them to sun!twitterpater.eng!atari-sources.

If you want verification of arrival, so say in a cover note, or at the beginning of your submission, if it is small. I try to verify that a program works, and if I can't get it to work, I may hold up posting it for a couple of days. Please note that, except in rare cases, source without documentation will not be published. The backlog from receipt to posting varies from one to four weeks depending mostly on the set of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a pain to separate them, and such submissions are invariably placed on the back burner. Sources should be submitted in the same format as binaries -- uuencoded arc, zoo, or lzh files. Please use Pierre Dumas' "uue" program if possible, as it can correct some common transmission errors. Split long submissions up into reasonable (less than 50K) chunks. "uue" will do this for you, if you use "uue -700 file" to encode.

Please inform me of any special system requirements, and what development environment was used, so that I can properly test your submission and label it when I post it.

Subject: The structure of comp.sources.atari.st articles

Each posting in comp.sources.atari.st is called an "issue"; there are roughly 100 issues to a volume. The division is arbitrary and may vary. There are two types of articles in comp.sources.atari.st: sources and "information postings." They can be distinguished by the subject line:

  Subject: v06INF2: Index for Volume 6 and other info

This first word in the title identifies this as the third info posting of volume one. Similarly, the subject line shown below:

  Subject: v06i081: godsrc -- Universe simulator

identifies this as the 81st source article in Volume 6. Large sources are broken up into smaller pieces, and have subject lines that look like this:

```
  Subject: v06i088: decbustr -- VMS clone in ST-LOGO, Part03/08
```

Certain information about the system configuration required to use the program is given on the keywords line.

```
  Keywords: MWC, Megamax, 1meg, high
```

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

```
  Alcyon  - Alcyon C (included with Atari developer's kit)
  MWC         - Mark Williams C
  Megamax - Megamax C
  Laser       - Laser C
  Lattice - Lattice C
  C       - Any C compiler
  OSS         - OSS Personal Pascal
  BASIC       - ST BASIC (this is not a joke!)
  uuencode    - program is uuencoded (uudecode required to unpack)
  arc         - program is archived (arc required to unpack)
  zoo-high    - program is archived (Zoo 2.1 required to unpack)
  lharc       - program is archived (lharc required to unpack)
  high        - high resolution
  medium  - medium resolution
  low         - low resolution
  1meg        - needs 1 meg of RAM
```

The References: line, if present, points to the previous part of a multi-part program, so that newsreaders (trn, nn, etc.) which can follow threads will recognize a large program as a single thread.

The first few lines of an article are auxiliary headers that look like this:

```
  Submitted-by: david@bdt.UUCP (David Beckmeyer)
  Posting-number: Volume 6, Issue 80
  Archive-name: micro-rtx
```

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

```
Archive-name: desktop/part01
```

Please try to use this name when requesting that sources be mailed to you.
Also, note that the "part number" given in the title, and the archive name
given in the auxiliary header need not be identical.

Since most archive sites run UNIX, articles are given UNIX-style filenames
rather than ST-style filenames. I do try to limit filenames to eight
characters whenever possible, though.

Subject: Reporting and tracking bugs and patches to postings

Most of the time, bugs and updates will be posted to comp.sys.atari.st.
Sometimes, "official" updates from the author will be posted submitted to
comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes
to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header.
Often there is a contact address in a README file, too. I do not maintain
the sources I moderate, so don't send your bug reports to me.

Subject: Listing of archive sites in no particular order

1. Site twitterpater is running an archive server, which automatically answers
   mail requests. Send mail to archive-server@twitterpater.eng.sun.com with the
   word "help" in the message body for more information. Both the sources
   and binaries groups are archived on twitterpater.
2. Unido is the European archive site. It's running an archive server
   similar to twitterpater's; send "help" to unido!archive-server for more
   information. Unido archives both the sources and binaries groups.

If you know of additional sites which reliably archive comp.sources.atari.st
(or comp.binaries.atari.st, for that matter), please tell me so I can add
them to the list.

NNTP-Posting-Host: twitterpater

Thanks to a nice vacation last week, the comp.binaries.atari.st and comp.sources.atari.st submission queues are now empty. Time to send in some more!

The rest of this message will sound a lot like a similar one in comp.sources.unix not long ago. You can stop reading here if you don't plan to submit things to either group.

My response time is usually nothing to write home about. Part of the reason is that I try to send things out in more or less the order they arrive (with some exceptions.) When I get a slew of three or four submissions that have problems (both source and binary included in one archive, weird archiver used to pack, whatever) they tend to sit at the head of the queue until I have time to deal with them. Perfectly clean submissions further back in the queue suffer as a result, and it takes a big chunk of free time like last week to get everything moving again.

So, in the name of keeping the trains running on time, I'm going to be a little stricter about rejecting submissions in the future. Up until now, the only reasons I rejected things were if I couldn't get them to unpack at all (usually due to data corruption) or if I tried them out and they didn't work. I'll still reject things for those reasons, of course, but I'll no longer spend time going through the zillions of different versions of LHarc one at a time to try to unpack something, trying to figure out which of the datafiles need to be included with both the source version and the binary version of something that arrived all in one chunk, or searching through the source code for a big comment in the middle that can be used as a description for the top of the article. If it's not pretty much ready to go when I get it, I'll tell you what's wrong with it and move to the next item. I'm still perfectly willing to repackage things with zoo if they come in packaged with arc (I feel the space savings, sometimes in excess of 30%, are worth it) or whatever -- but I'll limit myself to fiddling with the format of the submission in a coarse way, rather than shuffling through its contents.

There's nothing really new here; I'm not asking anything that hasn't been in the two groups' introductory articles pretty much from the start. Most submitters will be perfectly fine; in many cases, I don't have to touch incoming submissions at all, except to change the mail header to a news header. I don't expect to be able to do that all the

time, or even most of the time, but I'd like to stop the practice of spending three hours trying to get a single submission into a form people can use.

Feel free to post or mail comments or replies.

-Steve

Effective immediately, the submission address for comp.sources.atari.st is

atari-sources@hyperion.com

and the submission address for comp.binaries.atari.st is

atari-binaries@hyperion.com

The archive server will remain on twitterpater a little while longer, but it will be moving to hyperion.com shortly as well. I will post another note when that's about to happen.

Incidentally, for those wondering why both groups are dry, it's not because I've gotten slow again; my queues have been empty for a while, and no new submissions have been coming in.

Summary: archive-server@spud.hyperion.com

Sorry for the interruption in service. I now have the archive server running
on host spud.Hyperion.COM. As on twitterpater, the archive contains all the
software from comp.sources.atari.st and comp.binaries.atari.st since I started
moderating both groups. Ftp access to the archives may be available in the
near future; more information on that as it happens.

Send mail to archive-server@spud.hyperion.com with "help" as the subject for
more information. Mail me at archive-manager@spud.hyperion.com if you have
trouble (but not to request files -- archive-server is the address for that.)

Comp.sources.atari.st: Volume 0, Info 1
Archive-name: welcome

Welcome to comp.sys.atari.st! This newsgroup is for the posting of
sources and documentation for the Atari ST line of computers. To
submit sources, binaries and/or documentation, send them to:

{sun,decwrl,ucbvax}!imagen!atari-sources

If you are submitting sources, please specify the compiler/assembler under
which it was compiled; for both sources and binaries please specify what
resolution(s) in which the program will run and some documentation as to
what the program does and how to use it.

Sources will be posted with a subject line of the following format:

Subject: Vxxannnn typ:res:form short description

Where:
    xx   - is a 2 digit volume number
    annnn - is a letter followed by 4 digits which will uniquely
        identify the posting for online retrival

    typ   - the type of compiler/assembler used to compile the program:
        doc - documentation only, no sources
        mwc - Marc Williams C
        mmc - Megamax C
        drc - DRI (alcyon) C
        tdi - TDI Modula-2
        bas - Atari basic
        ltc - Lattice C
        dra - DRI (Alcyon) assembler
        pps - Personal Pascal
    res   - resolution(s) under which this will run:
        b&w - high resolution only
        med - medium resolution color only
        low - low resolution color only
        col - both med and low
        all - all resolutions
    form - one or more of the following seperated by semi-colons ';'
        these fields describe the order of programs that must
        be used to 'unpack' the posting:
        asc - ascii file, no unpacking necessary
        uue - use Dumas's uudecode (or Un*x uudecode)
        arc - use arc
        shr - use shar

For Example the subject line:

V01a0001 mwc:col:uue;arc desk acc to change screen color

would be a C program compilable under Marc Williams C which runs in all color resolutions; to 'unpack' it, the user would first use uudecode to generate an arc file, then use arc to extract the program, rsc files, documentation etc.

The idea behind the rather complex subject line is 2 fold; first you can see at a glance if the posting is usable on your system and second with a little work you can write a program which parses the subject line and unpacks the posting automatically.

All programs posted will be compiled and tested before they are posted.

There will be a facility for retrival of postings via email analogous to the BITNET online retrival system, more on that as soon as I get it working.

I'm sure that I've left out some compiler types or haven't covered everything, so feel free to send me email.

I think i've gone on long enough, send me some programs !!!

X.UC 4
X.SH NAME
Xuw \- unix windowing system for Macintosh
X.SH SYNOPSIS
X.B uw
X.br
X.B uwtool
X[ process ] [ arg1 arg2 ...  ]
X.SH DESCRIPTION
X.I Uw
Xis a server program on unix that works with the program
X.I uw
Xon the Macintosh.  It creates a pseudo-terminal for each window,
Xgiving the user up to seven `terminals' to work with.  The host
Xprogram multiplexes the output onto one RS\-232 line.
X.PP
X.I Uw
X(on the unix system) with
X.I uw
Xon the Macintosh emulate a Lear Siegler ADM-31 terminal (tset adm31), a
XTektronix 4010, and a DEC VT52.
XEach window (on the Macintosh) has its own terminal emulation and can be
Xresized at will; the program
Xkeeps an 80x24 line display in memory for each window, but only shows the
Xlower left portion possible.
X.PP
X.I Uwtool
Xcan be executed from unix while running
X.I uw
Xto create a new window/`terminal.'  If no arguments are given, it creates
Xa new `terminal' running csh.  If a process is named, it will create a new
Xwindow with that process running in it, and when that process is terminated
Xthe window will disappear.  (i.e. `uwtool vi foo' will create a new window
Xwith vi, editing the file foo, but the window will go away when vi is exited)
XAny arguements after the process name are passed as arguements to that process.
X.SH LIMITATIONS
X.I Uw
Xand
X.I uwtool
Xare of no use on unix unless
X.I uw
Xis being run on the Macintosh.
X.br
XIf there is a stream of output in one window there will be lag in
Xrecognizing characters typed in another.
X.SH SEE ALSO
```

```
X.I uw
Xdocumentation distributed with the Macintosh program.

X * copy this program is given provided that the copy is not sold and that
X * this copyright notice is included.
X *
X *
X * Two types of information are exchanged through the 7-bit serial line:
X * ordinary data and command bytes.  Command bytes are preceeded by
X * an IAC byte.  IAC bytes and literal XON/XOFF characters (those which
```

```
X * are not used for flow control) are sent by a CB_FN_CTLCH command.
X * Characters with the eighth bit set (the "meta" bit) are prefixed with
X * a CB_FN_META function.
X *
X * The next most-significant bit in the byte specifies the sender and
X * recipient of the command.  If this bit is clear (0), the command byte
X * was sent from the host computer to the Macintosh; if it is set (1)
X * the command byte was sent from the Macintosh to the host computer.
X * This prevents confusion in the event that the host computer
X * (incorrectly) echos a command back to the Macintosh.
X *
X * The remaining six bits are partitioned into two fields.  The low-order
X * three bits specify a window number from 1-7 (window 0 is reserved for
X * other uses) or another type of command-dependent parameter.  The next
X * three bits specify the operation to be performed by the recipient of
X * the command byte.
X *
X * Note that the choice of command bytes prevents the ASCII XON (021) and
X * XOFF (023) characters from being sent as commands.  CB_FN_ISELW commands
X * are only sent by the Macintosh (and thus are tagged with the CB_DIR_MTOH
X * bit).  Since XON and XOFF data characters are handled via CB_FN_CTLCH,
X * this allows them to be used for flow control purposes.

```
X[ process ] [ arg1 arg2 ...  ]
X.SH DESCRIPTION
X.I Uw
Xis a server program on unix that works with the program
X.I uw
Xon the Macintosh.  It creates a pseudo-terminal for each window,
Xgiving the user up to seven `terminals' to work with.  The host
Xprogram multiplexes the output onto one RS\-232 line.
X.PP
X.I Uw
X(on the unix system) with
X.I uw
Xon the Macintosh emulate a Lear Siegler ADM-31 terminal (tset adm31), a
XTektronix 4010, and a DEC VT52.
XEach window (on the Macintosh) has its own terminal emulation and can be
Xresized at will; the program
Xkeeps an 80x24 line display in memory for each window, but only shows the
Xlower left portion possible.
X.PP
X.I Uwtool
Xcan be executed from unix while running
X.I uw
Xto create a new window/`terminal.'  If no arguments are given, it creates
Xa new `terminal' running csh.  If a process is named, it will create a new
Xwindow with that process running in it, and when that process is terminated
Xthe window will disappear.  (i.e. `uwtool vi foo' will create a new window
Xwith vi, editing the file foo, but the window will go away when vi is exited)
XAny arguements after the process name are passed as arguements to that process.
X.SH LIMITATIONS
X.I Uw
Xand

X * copy this program is given provided that the copy is not sold and that
X * this copyright notice is included.
X *
X *
X * Two types of information are exchanged through the 7-bit serial line:
X * ordinary data and command bytes.  Command bytes are preceeded by
X * an IAC byte.  IAC bytes and literal XON/XOFF characters (those which
X * are not used for flow control) are sent by a CB_FN_CTLCH command.
X * Characters with the eighth bit set (the "meta" bit) are prefixed with
X * a CB_FN_META function.
X *
X * The next most-significant bit in the byte specifies the sender and
X * recipient of the command.  If this bit is clear (0), the command byte
X * was sent from the host computer to the Macintosh; if it is set (1)
X * the command byte was sent from the Macintosh to the host computer.
X * This prevents confusion in the event that the host computer
X * (incorrectly) echos a command back to the Macintosh.
X *
X * The remaining six bits are partitioned into two fields.  The low-order
X * three bits specify a window number from 1-7 (window 0 is reserved for
X * other uses) or another type of command-dependent parameter.  The next
```

```
X * three bits specify the operation to be performed by the recipient of
X * the command byte.
X *
X * Note that the choice of command bytes prevents the ASCII XON (021) and
X * XOFF (023) characters from being sent as commands.  CB_FN_ISELW commands
X * are only sent by the Macintosh (and thus are tagged with the CB_DIR_MTOH
X * bit).  Since XON and XOFF data characters are handled via CB_FN_CTLCH,
X * this allows them to be used for flow control purposes.

Archive-name: ibmfmt.c

~-~-~-
```

uses 3.5" disks nor do I have a 5 1/4" B: disk. The program does compile
under MegaMax C and runs as far as I can test it.

the checksum is:

```
bytes =     5891(     6071)   cksm = 1030   ibmfmtr.c
```

~~~~~~

Hi, James!

Here is a submission for comp.*.atari.st (some for each):

This is a corrected version of the 200% MS-DOS-compatible formatter.
It will format 3.5" (720K, MS-DOS 3.3) disks in drive A and 5.25" (360K,
MS-DOS 2.0) disks in drive B (assuming you have a 5.25" drive attached
as drive B!). (Sorry, no frills!) The disks are NOT bootable (on MS-DOS)
but both the Atari ST and MS-DOS machines can read and write files on
them, even in subdirectories. The correction (of the early version that
I posted to comp.sys.atari.st) is that now a random disk ID is created.
In the early version, the same ID was always used (stupid me!).

Thanks for doing the moderation job (must be a pain)!

- Moshe Braner

Here is the source code (Megamax C), followed by the uuencoded binary.

```
------------------ cut here ------------------
/**
 **  Program to format MS-DOS-compatible disks on the Atari ST
 **  Code for Megamax C compiler 871023
 **/

comp.sources.atari.st: Volume 0, Info 1
Archive-name: howto.use

Introduction:

This document outlines the purpose of comp.sources.atari.st and comp.binaries.atari.st; how to 'unpack' postings; and how to submit files to the groups for posting. These groups are moderated by me in my copious (:-) spare time and turn around may be a little slow. Don't be afraid to send me mail asking me what the ^$%# happened to your submission. Every program submitted to me is tested to the best of my abilities and hardware. If I can not fully test a submission, because I don't have appropriate hardware or I don't know the language being used, I will put a caveat in the posting warning the user to that effect.

Purpose:

The moderated groups were created to lessen the traffic created by multiple postings (as in: I lost part n, could someone repost it) and to provide a relatively reliable posting. To that end I download every posting; compile it (if appropriate); test it; document it (if necessary); checksum it; repackage it; locally post it; unpackage it and recheck the posting; and finally post it to the net. This process is fairly time consumming and therefore frustrating to the poster who would (very reasonably) like to see their posting see the light of day as soon as possible; have patience !

Contents:

Each posting consists of the following parts:

- Subject line with usage information
- Editor's note

checksums
the posting

1. Subject line

The subject line consists of a 3 field code which gives some information on the contents of the posting and a quick summary of what is in the posting. The 3 fields are seperated by ':'s and may in turn contain subfields seperated by ';'s. The first field is a 3 digit code that describes the language in which the posting is written. Some examples are:

bin - the posting is a binary (executable) only
mwc - the posting is written in Marc Williams C
mmc - Megamax C
drc - DRI (Alcyon) C
bas - basic
pps - Personal pascal
dra - Alcyon assembler
mwa - Marc Williams assembler
mad - MadCap assembler
pro - prolog
doc - documentation file (no executables)

(I will add more as the need arises)

The second field contains the resolutions in which the program will run, if it can run in more than 1 resolution, then they seperated by ';'s. The values are:

all - all resolutions
b&w - monochrome
low - low res color
med - hi res color

The third field lists the filters that need to be run to 'unpackage' the posting, that is get it into a format that can be used on the ST. If more than one filter needs to be used they are seperated by ';'s and listed in the order that they must be executed. The values are:

shar - Un*x Bourne shell
uue - uudecode
arc - arc
     - (empty) posting is usable as is

for example, uue;arc would mean that you must first run the uudecode program on the posting, then run the arc program on the output of the uudecode program.

Editor's Note:

This is a (hopefully) quick note from me explaining what the posting is about, any gotcha's that I found in using it, etc.

Checksums:

These are the checksums for each part (if more than one) of the complete posting

How to 'unpackage' postings:

The 2 most popular methods for packaging posting are shar format for sources and uue;arc for binaries. To unpack a shar format simpley remove the leading headers (usually marked by a line stating 'run sh on everything that follows...') and trailing signatures and run the stripped file thru the Un*x sh command (sh filename). This will unpack and check each file in the shar. If you are not running Un*X then you need to manually seperate the parts with an editor (what a pain).
To unpackage a uue;arc submission execute the following steps:

1. look at the line 'begin part ...' in the first (or only) part and save the file as that filename with the file extension '.uue' you need not change the file as uudecode ignores everything before the 'table' line. If the posting has more than 1 part name then the file extension to part 1 should be '.uaa' and the filename for part 2 'filename.uab', part 3 'filename.uac' etc. For example a 3 part posting of the gulaam.ttp program would be saved as:

gulaam.uaa
gulaam.uab
gulaam.uac

It should be noted that this is for the 'official' uudecode program from John-Pierre Dumas that is posted periodically to the group comp.binaries.atari.st. Other versions of uudecode may be used but their naming conventions may be different. The other most popular form of file naming would name the above 3 parts:

gulaaa.uue
gulaab.uue
gulaac.uue

In general the naming convention is only a formality, the basic format of a uue file is understood by all flavours of uudecode.

2. type 'uudecode filename.uue' for single part postings or 'uudecode filename.uaa' for multiple parts, the other parts will be automatically linked in.

3. you should now have a file named 'filename.arc' (gulaam.arc in our example), type 'arc x filename' to extract the pieces of the original posting.

4. that's it.

The chicken or the egg:

One major problem has been how to post the uuen/decode binaries without putting them into a uue format. To that end a uudecode.bas program is periodically posted to the net, this is a 'bootstrap' version which will decode the uuencode... (you get the idea). This program does NOT understand anything before the 'begin' line or after the 'end' statement.

How to submit files:

mail submissions to:

....{decwrl,ucbvax}!imagen!atari!turner

PLEASE include documentation as to what the file contains, how to use it, etc. If it is a binary file, remember to uuencode it first as most mailer can't handle binary (non-ascii) characters.

Toolkit:

The full set of programs used in decoding files from the moderated groups are:

```
uudecode.bas - basic program used to decode the real uudecode.ttp
uudecode.ttp - decode encoding postings
uuencode.ttp - encode binaries for posting
arc.ttp      - archive/dearchive groups of binaries files
cksm.ttp     - checksum a file
```

Archives:

At this time, all files posted to both moderated groups are also mailed to ...umix!hyc (Howard Chu) who maintains an archive available to both usenet and ARPAnet. Contact him for more details.
